# Assessing the Intended Nationally Determined Contributions of ADB Developing Members

Janet Arlene Amponin and James Warren Evans

No. 44 | August 2016

Janet Arlene Amponin is an independent consultant. She has consulted with ADB for the past 7 years, focusing on clean energy, financing partnership facilities, and climate technologies and finance. She currently consults with the Climate Change and Disaster Risk Management Division under the Sustainable Development and Climate Change Department of ADB.

James Warren Evans is an independent consultant. He provides advisory assistance to public and private sector organizations, particularly on innovation and scaling up action and finance for low-carbon, climate-resilient development. He previously held technical and managerial positions at the World Bank and ADB. He currently consults with the Climate Change and Disaster Risk Management Division under the Sustainable Development and Climate Change Department of ADB.

## **ACKNOWLEDGMENTS**

This working paper was prepared by Janet Arlene Amponin (consultant) and James Warren Evans (consultant), under the supervision and guidance of Preety Bhandari, director, Climate Change and Disaster Risk Management Division (SDCD) of the Sustainable Development and Climate Change Department of the Asian Development Bank. Inputs and overall support were also provided by staff of SDCD.

The authors also acknowledge the valuable contributions provided by Jane Olga Ebinger, managing director, Policy and Knowledge for Sustainable Energy for All.

## EXECUTIVE SUMMARY

At the United Nations Climate Change Conference, 21st Session of the Conference of the Parties (COP21) in Paris in December 2015, 195 countries adopted the first universal and binding global climate deal, which sets out a global action plan to avoid dangerous climate change by limiting global warming well below 2°C and, if possible, below 1.5°C. The urgency of the challenge is amplified by the fact that the world could hit the 1.5°C increase this year.

The Paris Agreement on global climate change action is largely anchored on the implementation between 2020 and 2030 of Nationally Determined Contributions (NDCs). In support of reaching an international agreement on climate change, countries were invited to submit their Intended NDCs (INDC) to the United Nations Framework Convention on Climate Change (UNFCCC) ahead of or at COP21. INDCs outline the countries' post-2020 climate actions to contribute toward the 2°C global warming limit. The INDCs are voluntary, but they become firm commitments as NDCs once the Paris Agreement is ratified and comes into effect. For the Paris Agreement to enter into force, 55 Parties, representing at least 55% of global emissions, must join.

By the end of 2015, all but two developing member countries (DMCs) receiving assistance from the Asian Development Bank (ADB) submitted an INDC indicating their commitments for adapting to climate change impacts and reducing greenhouse gas (GHG) emissions starting in 2020 (in most cases effective until 2030). The DMC NDCs should eventually serve as country-driven road maps for climate action, which ADB and other sources of climate/development finance and technical assistance will utilize to identify the sectors and locations for which they provide climate change-related support.

The NDCs present an opportunity for multilateral development banks (MDBs) to strategically mobilize public and private sector finance to support DMCs' transition to climate-resilient, low-carbon economies. Most MDBs committed to scale up climate financing prior to COP21: for example, ADB committed to doubling climate finance to \$6 billion by 2020. The NDCs should help MDBs strategically program the scaled-up climate finance.

This working paper outlines the preliminary review of the DMC INDCs to contribute to the refinement of ADB's strategic approach to support DMC climate action and remain attuned with DMC needs and priorities. ADB recognizes the important opportunity that adoption of INDCs provides in terms of guiding future ADB operations. The review of each DMC commitment is intended to determine the extent to which ADB's current country program/pipeline is aligned with the stated priorities of the DMC with regard to climate action and consider if and how ADB might scale up support. Understanding the ADB program alignment with INDCs should facilitate discussion between ADB and each DMC as to whether and how the country would expect additional or different forms of support on climate actions from ADB.

ADB is currently defining its long-term climate change strategic directions through 2030. The first phase is intended to facilitate a strategically oriented program of activities by ADB to meet its \$6 billion climate finance target and mobilize other financial and technical assistance resources to complement and support ADB actions. The climate change strategic directions will enable ADB to shift from an opportunity-based approach to funding climate action in DMCs and at the subregional and regional levels to a much more strategic, tactical approach based on countries' NDCs.

The review of the DMC INDCs shows that there is a large range of details presented by each country with regard to the actions and their estimated costs, as well as the need for external financial and technical support. None of the INDCs would match a "sector investment plan" in terms of technical, spatial, temporal, and financial details which ADB operational departments are accustomed to relying on for country operational planning. However, a few DMC INDCs are adequately detailed so that they can be readily translated into climate action plans that are similar in planning detail to sector plans. Many of the more detailed INDCs are summaries of more detailed national climate action plans and other sector plans—these can be readily built upon to translate them into climate investment plans or road maps. Well-developed NDCs will be useful in facilitating a country dialogue with ADB and other sources of financial and technical assistance. Currently, less detailed INDCs indicate a need for support

from institutions such as ADB to define objectives and outline actions that will help a country meet its objectives and commitments and then set priorities for investments in the form of climate investment plans. ADB will work with other international and bilateral development assistance partners at the regional and DMC levels to agree on how the development assistance community can most effectively and efficiently (avoiding duplication) support DMCs to improve the clarity and detail of NDCs, and subsequently support their implementation.

## I. INTRODUCTION/BACKGROUND

### A. What COP21 and the Paris Agreement Mean to Multilateral Development Banks

The 2015 United Nations Climate Change Conference, the 21st session of the Conference of the Parties (COP21) held in Paris, France, from 30 November to 12 December 2015, 195 countries adopted the first universal and binding global climate deal, the Paris Agreement<sup>1</sup>, which sets out a global action plan to avoid dangerous climate change by limiting global warming well below 2°C and, if possible, below 1.5°C.<sup>2</sup> The COP21 achieved significant progress in that most developed and developing countries made emission reduction and adaptation commitments in the form of intended nationally determined contributions (INDCs)<sup>3</sup>. INDCs outline the countries' post-2020 climate actions to contribute toward the 2°C global warming limit. For most countries, they cover greenhouse gas (GHG) emission reduction targets in energy, industry, agriculture, waste, land use and forestry, and transport—the sectoral focus varies from country to country. Several countries also outlined their adaptation plans and financing needs, but these tend to be very general. In addition, among other accomplishments, the Parties to the United Nations Framework Convention on Climate Change (UNFCCC) (negotiating countries) agreed on a new sustainable development mechanism that will strengthen the linkage of climate action with the achievement of the Sustainable Development Goals (SDGs).

The INDCs are voluntary, but they become firm commitments as nationally determined contributions (NDCs) once the Paris Agreement is ratified and comes into effect. For the Paris Agreement to enter into force, 55 Parties, representing at least 55% of global emissions, must join.<sup>4</sup> The Paris Agreement also calls for a review of the NDCs every 5 years as part of a “global stocktake”, to track progress against the target and allow countries to make new and more ambitious pledges. A facilitative dialogue to review progress is scheduled in 2018, with the first global stocktake set in 2023.

The INDC GHG reduction commitments are insufficient to meet the agreed 2°C maximum target increase in mean temperature above pre-industrial levels. Nevertheless, potential progress in this regard is significant in that business-as-usual (BAU) emissions would lead to a 4°C–5°C increase by 2100, while the current INDC emission reduction pledges would lead to a 2.7°C–3.7°C increase by 2100.<sup>5</sup> The new commitments are sufficient to bend the curve of emissions growth but will not reverse it.

The COP21 was not very successful in securing adequate, long-term financial support for climate action. The current funding for a low-carbon transition is inadequate to meet the commitments of the developing countries, many of which have set a two-stage emission reduction target—one utilizing domestic resources and the other higher commitment dependent upon access to climate finance. In this regard, many of the mitigation actions proposed in the INDCs of several developing member countries (DMCs) are conditional upon access to additional and concessional finance. The Paris Agreement on NDCs presents an opportunity for multilateral development banks (MDBs) to strategically mobilize public sector and private sector finance to support DMCs' transition to low-carbon economies. Most MDBs committed to scale up climate financing prior to COP21. For example, the Asian Development Bank (ADB) has committed to doubling climate finance to \$6 billion by 2020. The NDCs should help MDBs strategically program the scaled-up climate finance. It is expected that the technology and financial risks will decline over time as the investments in low-carbon development, particularly new technologies, snowball in a few years.

<sup>5</sup> World Resources Institute. INSIDER: Why Are INDC Studies Reaching Different Temperature Estimates? <http://www.wri.org/blog/2015/11/insider-why-are-indc-studies-reaching-different-temperature-estimates>

Over the coming year, it is expected that ADB will refine its strategic approach to supporting low-carbon actions in DMCs, based on demand, both for public and private sector investments as well as public–private partnerships (PPPs). In parallel, it is likely that MDBs, such as ADB, will play an important role in providing technical assistance to DMCs to refine their NDCs so that they are translated into prioritized low-carbon and climate-resilient investment plans.

## **B. Purpose/Limitations**

This working paper provides a preliminary review of the INDCs of ADB’s DMCs, following the adoption of the Paris Agreement, to support the refinement of ADB’s strategic approach, and remain attuned with DMCs’ needs and priorities. Of the 40 DMCs receiving ADB assistance, 38 have submitted an INDC to the UNFCCC and all are covered in this analysis.<sup>6</sup>

The analysis focuses on three key elements of the INDCs: i) contributions to GHG emission reduction; (ii) sector climate actions/priorities; (iii) and support requirements, with a focus on financing. The review of DMCs’ commitments and climate action priorities is particularly useful to facilitate ADB strategic planning on regional and country operations, for enhancing climate investments, in support of ADB’s \$6 billion climate finance institutional target. Eventually, it is expected that NDCs will be refined and, for several DMCs, will become investment plans that ADB can use in its programming. An initial review of the alignment of the current ADB public sector pipeline with the INDCs shows that the ADB programs are broadly aligned.

## **C. Outline**

An overview of efforts to analyze and interpret INDCs is provided in Section 2. Section 3 highlights the climate change vulnerability of the Asia and Pacific region. Section 4 presents an assessment of the INDCs submitted by ADB’s DMCs. The assessment specifies the intended mitigation contributions, and summarizes and highlights the key priority measures of DMCs across key sectors as well as the expected financing requirements (i.e., estimated costs and source/s) to support the implementation of the INDCs. Section 5 suggests a strategic approach for ADB to support its DMCs in implementing their respective INDCs. Section 6 concludes with key observations.

---

<sup>6</sup> Timor-Leste and Uzbekistan have not submitted their INDCs.

## II. OVERVIEW ON CURRENT INDC LITERATURE

A number of international organizations initiated reviews and assessments of INDCs leading up to and following the COP21. The leading work is the synthesis report prepared by the UNFCCC Secretariat, initially released in October 2015 and updated in May 2016. The synthesis report compiles and presents the aggregated information of 161 INDCs from 189 countries, in particular, the aggregate GHG emission levels in 2025 and 2030 resulting from the implementation of the INDCs, which are compared with emission levels in 1990, 2000, and 2010, and with emission trajectories.<sup>7</sup> The report noted that the implementation of the communicated INDCs would lead to sizable lower aggregate global emission levels than in pre-INDC trajectories; however, they do not fall within the scope of least-cost 2°C scenarios by 2025 and 2030. It also provided synthesized information on the INDCs: for example, how much of the INDCs (i) are national in scope; (ii) have conditional and unconditional mitigation targets; (iii) are supported by existing national laws; (iv) highlight support from actors such as the private sector, academia, and civil society; (v) provide information on their support needs; and (vi) communicate information on domestic measures to support INDC implementation.

Other efforts for better understanding of the INDCs include interpreting INDC transparency (i.e., completeness and clarity) in reducing GHG emissions, assessing whether countries are on track to meet the intended contributions given currently implemented policies, and/or analyzing level of ambition by comparing INDCs with current climate policies and BAU development, and collating and summarizing key information (e.g., mitigation or GHG emission reduction contributions, market mechanisms, etc.).

Appendix 1 contains a brief and early review of analyses made on INDCs of four DMCs, i.e., the People’s Republic of China (PRC), India, Indonesia, and the Philippines. A preliminary review of literature was undertaken by ADB as an initial effort to understand the scope and depth of DMC INDCS as they might relate to ADB technical and financial assistance planning. The review mainly covers i) the working paper prepared by the World Resources Institute (WRI) that evaluates the transparency of the GHG emissions targets presented in selected INDCs and presents the GHG emissions trajectories of eight top emitting Parties—which includes the PRC, India, and Indonesia;<sup>8</sup> ii) the assessments made by the Climate Action Tracker (CAT) on whether countries are on track to meet the pledges, given currently implemented policies, and rated their pledges against the range of emission levels they should aim for in the framework of a 2°C global pathway;<sup>9</sup> and iii) the assessment prepared by the PBL Netherlands Environmental Assessment Agency, which provides an overview of the INDCs submitted and analyses on their level of ambition.<sup>10</sup> These documents were supplemented with other INDC-related documents available online.

The WRI working paper presented key messages on the INDCs analyzed. Among others, it highlighted that transparency gaps remain for all Parties, affecting the understanding of proposed GHG emissions targets, and the degree that transparency is associated with targets, i.e., absolute/base-year GHG emissions targets tend to have been presented more transparently than other target types. On the other hand, the CAT has assessed the intended mitigation contributions of ADB’s DMCs as mostly of “medium” rating, which indicates that the commitments are not consistent with limiting warming below 2°C, and greater effort or deeper reductions from other countries are required (Box 1). Further, the CAT has noted that overall climate pledges, if met by all governments, would result in about 2.7°C of warming by 2100.<sup>11</sup> The gap may be substantially reduced if government conditions are met, allowing them to enhance climate actions to achieve conditional targets in the INDCs.

### Box 1: Are the Climate Pledges of ADB Developing Member Countries Consistent with the 2°C Global Temperature Limit?

The **Climate Action Tracker (CAT)**<sup>a</sup> has assessed the fair sharing of the proposed contributions of selected countries on efforts to move global emissions downward through 2030. It provided ratings on intended nationally determined contributions (INDCs), pledges, and current policies, specifically on whether they are consistent with a country's fair share effort to holding warming to below 2°C.<sup>b</sup> The assessment included six developing member countries of ADB: Bhutan, India, the People's Republic of China, Kazakhstan, the Philippines, and Nepal. The summary of the assessments is as follows:

- **Bhutan's** pledge was rated "sufficient" for 2025, and it is the only country ever rated "Role Model." This rating is based on emissions excluding land use, land-use change, and forestry (LULUCF) and takes into consideration that, as a developing country with currently very low emissions per capita, Bhutan's emissions are expected to grow over this time period. Gradual reductions will be needed afterward.
- **India's** pledges were rated "medium." The pledges are in line with effort sharing approaches that focus on equal cumulative per capita emissions. Approaches that focus on historical responsibility and capability would require more stringent emission reductions. Current policy projections for 2030 are in line with fair shares based on converging per capita emissions for all countries to the same level (equality), and staged approaches. The "medium" rating indicates that India's climate commitments are at the least ambitious end of what would be a fair contribution. This means it is not consistent with limiting warming to below 2°C unless other countries make much deeper reductions and comparably greater effort.
- The emission levels estimated for the **People's Republic of China** for 2025 and 2030 resulting from all aspects of the INDC, except the carbon intensity target, are rated "medium." However, the emissions resulting from the 2030 carbon intensity target, if taken in isolation, are significantly higher and would be rated as "inadequate." The CAT analysis shows that intensity target would only be reached at the expense of the INDC goal of peaking CO<sub>2</sub> emissions by 2030 or earlier, and at the expense of important national policies and actions, including policies targeting air pollution, which is judged as unlikely.
- **Kazakhstan's** unconditional INDC target is rated "medium." This rating indicates that Kazakhstan's climate plans are at the least ambitious end of what would be a fair contribution. This means it is not consistent with limiting warming to below 2°C unless other countries make much deeper reductions and comparably greater effort.
- **The Philippines'** climate commitments are rated "medium" as it is at the least ambitious end of what would be a fair contribution. Both implemented and planned policies are not sufficient to achieve the INDC target. It is not consistent with limiting warming to below 2°C unless other countries make much deeper reductions and comparably greater effort. Emissions growth will be predominantly driven by increased emissions from transport and coal-fired electricity generation. Without the renewable energy and energy efficiency targets, emissions under current policies (excluding LULUCF) are expected to increase. If all coal power plants that were announced are constructed, total emissions will likely evolve in line with the high end of current policy projections.
- **Nepal** has not made any emissions reduction pledge, hence no rating was provided. Its own emissions make up less than 0.1% of global emissions. With its current policies, Nepal's greenhouse gas emissions are expected to increase by 62% by 2030 compared with 2010 levels. Nepal's projected emission levels in 2020, 2025, and 2030 are in the "sufficient" range. CAT analysis determined an upper end of the "medium" range for Nepal using effort-sharing approaches based on equality principles. To be in line with approaches that focus on responsibility and capability, Nepal would need to reduce its emissions from its current policy projected levels.

<sup>a</sup> Climate Action Tracker. <http://climateactiontracker.org/>

<sup>b</sup> An "inadequate" rating indicates that inadequate commitments and warming likely to exceed 3°C-4°C. A "medium" rating indicates that commitments are not consistent with limiting warming below 2°C and greater effort or deeper reductions from other countries are required. A "sufficient" rating indicates that the commitments are fully consistent with below 2°C. A "role model" indicates a more than consistent commitment.

Source: Climate Action Tracker. <http://climateactiontracker.org/countries.html>

As with the UNFCCC synthesis report and the CAT findings, the PBL Netherlands Environmental Assessment Agency assessment noted that the collective ambition of the INDCs put forward in 2030 falls short of what is needed to put the world directly on a cost-effective pathway to keep the global temperature increase below 2°C; however, if fully implemented, the INDCs will deliver significant emission reductions from BAU.

A policy paper prepared by the Center for Clean Air Policy (CCAP)<sup>12</sup> and released prior to COP21 highlighted the importance of converting or turning INDCs into policies, measures, and finance-ready investment strategies for effective operationalization of goals (i.e., transforming them into on-the-ground actions) and attracting public and

<sup>12</sup> Center for Clean Air Policy. <http://ccap.org/about-ccap/mission/>

private international financing.<sup>13</sup> The policy paper analyzed selected INDCs, with focus on emission reductions, sector planned actions, and financial information, to determine what converting INDCs into investment strategies would involve. It finds, among others, that while many INDCs provided information that signals country priorities, greater specificity is required to allow conversion into policies, programs, and investment plans. The paper concluded that countries will require different types of support, with some requiring comprehensive support while others are ready to start mobilization of finance. Opportunities for financial, technology, and capacity-building support exist such as the Green Climate Fund (GCF), Global Environment Fund (GEF), and from bilateral and multilateral contributors, to help countries through the INDC conversion process.

Building on this analysis and other discussions and developments, the CCAP also prepared a policy brief that provides the key elements and necessary steps in converting INDCs.<sup>14</sup> It has identified key elements for strengthening INDCs as (i) quantified information on national and sectoral goals; (ii) fully specified policies, measures, mandates, and enabling frameworks to meet the goals; and (iii) required government spending, international public and private financing, and other policy mandates to meet the costs. Further, the policy brief informs on the steps to carry out INDC conversion including clarifying priorities and goals, and analysis and selection of options to achieve goals subject to technical and political considerations.

Another useful document was published by Investor Watch and focused on financing of country climate actions prescribed in the INDCs.<sup>15</sup> The report recognized the need for mobilization of substantial capital, and keys to this are the increase in quality of information, i.e., reflective of investment opportunities and needs; and linkage of investments to national climate action plans. It recommended the creation of categorization of mitigation and adaptation actions, which would be helpful in aggregating and analyzing data for markets and policy makers as well as in reporting on climate finance. It also recommended building on the INDCs and creating climate investment plans (CIPs), with concrete investment opportunities and funding proposals, which will be helpful in attracting financial investments and support.

Key web pages containing collated and processed information on the INDCs were also developed and established by various institutions, for easier tracking of country commitments and actions. The WRI has launched an interactive mapping tool for monitoring of countries that have signed and joined the Paris Agreement, against reaching the target of at least 55 countries covering 55% of global emissions, to bring the agreement into force.<sup>16</sup> The Institute for Global Environmental Strategies (IGES) has also established a database, compiling latest INDC information with focus on market mechanisms, enabling comparative analysis across regions and countries.<sup>17</sup> For Asia and Oceania regions, IGES has included a total of 25 countries, including 16 DMCs of ADB, claiming use of market mechanisms in their INDCs.

The Australian–German Climate and Energy College of the University of Melbourne has also developed, in cooperation with the PRIMAP group at the Potsdam Institute for Climate Impact Research, a portal that provides the quantified INDC Factsheets of 188 countries.<sup>18</sup> Specifically, the factsheets contain estimates on GHG emissions, with projections for 2020, 2025, and 2030 based on 1990, 2000, 2005, and 2010 figures, including coverage in the INDCs. Based on the GHG emission projections for 2030, percentage increases were observed for most of the DMCs and reduction in only a number of DMCs (Table 1).

- = no data, ( ) = negative, ADB = Asian Development Bank, GHG = greenhouse gas, INDC = intended nationally determined contributions, mtCO<sub>2</sub>eq = metric ton of carbon dioxide equivalent.

Notes:

a) No INDC Factsheet is available for Timor-Leste.

b) Based on email correspondence with Prof. Malte Meinshausen, Director of the Climate and Energy College of the University of Melbourne, the "low" scenario is the low emission case which is taken as the lower end of the range of the conditional INDC pledge. If there is no conditional pledge, the lower end of the range of the unconditional pledge is taken. On the other hand, the "high" scenario is the high emission case which is taken as the higher emission end of the range of the unconditional INDC pledge. In both scenarios, if no quantification could be undertaken, reference scenario levels have been assumed.

Source: University of Melbourne. Australian-German Climate and Energy College. INDC Factsheets.. <http://www.climate-energy-college.net/indc-factsheets> (accessed on 28 April 2016).

This review of literature is not exhaustive and is intended to present the various efforts to monitor and analyze the INDCs. Overall, these materials and documents would be helpful in better understanding the pathways, and aligning strategies, actions, and collaborative support, for the effective implementation of the INDCs.

### III. CLIMATE CHANGE IN THE ASIA AND PACIFIC REGION

#### A. Climate Change Impacts

The impacts of climate change are already being felt, and increasingly so, across the Asia and Pacific region. According to the President of Kiribati, the impacts of climate change will force people to start leaving his island country by 2020.<sup>19</sup> Many of the world's most vulnerable countries are ADB's DMCs (Box 2). The new Vulnerable 20 Group includes Afghanistan, Bangladesh, Bhutan, Kiribati, the Maldives, Nepal, the Philippines, Timor-Leste, Tuvalu, Vanuatu, and Viet Nam.<sup>20</sup> But other studies indicate that the large, highly populated countries such as the PRC, India, and Indonesia, will pay the highest financial price tags for adapting to climate impacts.

#### Box 2. Vulnerability of ADB Developing Member Countries

Based on the **Global Climate Risk Index (CRI)**,<sup>a</sup> six of the 10 countries most affected by extreme weather events from 1995 to 2014 (based on average, weighted ranking or the CRI score) are developing member countries of the Asian Development Bank: Myanmar (rank 2), the Philippines (4), Bangladesh (6), Viet Nam (7), Pakistan (8), and Thailand (9). In 2014, five of the 10 most affected countries are in Asia: Afghanistan (2), the Philippines (4), Pakistan (5), Nepal (7), and India (10). These countries were affected by landslides, heavy rains, typhoons, tropical storms, heavy monsoon rains, and floods that killed thousands of people, displaced families, caused widespread damages to homes and agriculture, and threatened food security.

<sup>a</sup> Developed by Germanwatch, the Global Climate Risk Index analyses the quantified impacts of extreme weather events, both in terms of fatalities as well as economic losses that occurred, based on data from the Munich Re NatCatSERVICE. Extreme weather events include meteorological events such as tropical storms, winter storms, severe weather, hail, tornados, local storms; hydrological events such as storm surges, river floods, flash floods, mass movement (landslide); and climatological events such as freezing, wildfires, and droughts.  
<https://germanwatch.org/en/download/13503.pdf>  
Source: S. Kreft et al. 2015. *Global Climate Risk Index 2016: Who Suffers Most from Extreme Weather Events? Weather-related Loss Events in 2014 and 1995 to 2014*. Briefing Paper. Bonn: Germanwatch e.V.

The scientific understanding of climate change, its causes, likely future scenarios, and impacts on communities and ecosystems has dramatically improved during the last decade. The science continues to improve with a steady stream of peer-reviewed journal papers that almost all indicate warming is happening faster than was thought just a few years ago—the world is fast approaching 1.5°C average temperature rise above pre-industrial limits. The new information also points toward a stronger correlation between severe climate events and climate change. This means that the stated optimistic target in the recent Paris agreement of limiting to 1.5°C increase is not very likely since atmospheric concentrations of carbon dioxide are also now at record highs. The other general conclusion that can be drawn from the literature of the last 5 years, strengthened by emerging findings, is that the impacts of climate change will be felt faster and more severely than earlier thought, and that the differences of impact severity between 1.5°C, 2°C, 3°C, and 4°C, and beyond are highly significant.

The scientific community is increasingly concerned about the natural climate system being pushed beyond tipping points. Two irreversible impacts will be sea-level rise and the extermination of some species. The impacts are not linear-modeling, and modern observations of ice melt, sea-level rise, and superstorms point toward the likelihood that 2°C global warming could be much more dangerous than earlier perceived,<sup>21</sup> suggesting that the target of limiting global warming to 2°C does not provide adequate safety for vulnerable communities.

A recent study looking at the differences between a 1.5°C and 2°C global warming level, including extreme weather events, water availability, agricultural yields, sea-level rise, and risk of coral reef loss, demonstrates substantial differences in the impacts between these two levels of warming. The additional 0.5°C increase in global mean temperature marks the difference between the upper limit of present-day natural variability and a new climate regime, particularly in tropical regions.<sup>22</sup>

When assessing the likely impacts of climate change on Asia and Pacific DMCs, high levels of uncertainties in the scenarios and ranges of study conditions must be recognized. Most studies are now focusing on a 2050 impact scenario based on varying 2100 temperature rises. Recognizing these uncertainties is important because they are translated into uncertainties in development planning—particularly at the investment project level. There are questions that need to be asked: when, where, and how severe are impacts likely to be, and how does that relate to the economic, technical, social, and environmental viability—the sustainability—of the investment. More immediate, and related to these questions, is the need to strengthen the linkage between the plausible impact scenarios and country INDCs so that climate investment plans with priorities, timelines, and budgets/financing can begin to emerge to guide national climate and development action.

The following is a brief summary of some of the recent literature relating to climate impacts in Asia and the Pacific.

The combined effects of major global shifts from economic growth, climate change, and technological advances will be felt over the next decades in different places and with different results, but the greatest adverse impacts will be felt by DMCs that are less resilient to shocks and less able to manage and adapt.<sup>23</sup>

Climate change will affect biodiversity, freshwater resources, coastal areas, cities, food production, health, and the oceans—meeting just about every human need is linked to climate change. The extent of climate impact and the extent to which the natural and human-constructed resource base is able to adapt will depend on the level and pace of temperature rise. The temperature rise will largely depend on increases in the amount of human-generated GHG emissions. If countries meet their current commitments to reduce GHGs, then the world is likely to warm by about 2.7°C–3.7°C by 2100. (footnote 5) BAU would result in the increases being closer to 4°C–5°C by the end of the century.

What would a 4°C warmer world look like for ADB's DMCs? Examples of likely impacts are as follows:<sup>24</sup>

- Glacial melt, already affecting some vulnerable areas in the Himalayas, would reduce water availability for hundreds of millions of poor people.
- Many coastal and pelagic fish stocks will disappear, while others will be relocated thousands of kilometers away, raising major food security issues.
- Sea-level rise is a real threat to the coastal areas of the region, with all low-lying island countries and coastal cities at great risk from a projected sea-level rise of 50 centimeters above current levels by midcentury—a full meter by 2090.
- Typhoons will have associated extreme rainfall one-third stronger than before, reaching 50–80 millimeters per hour.
- Some parts of the region will suffer monthly heat extremes in a 2°C hotter world that currently do not exist. These extremes are projected to cover 60%–70% of land in the northern summer, with 30%–40% of the extremes at unprecedented levels. With a 4°C warming, today's unprecedented summer heat peak levels

<sup>21</sup> J. Hansen et al. 2016. Ice Melt, Sea Level Rise and Superstorms: Evidence from Paleoclimate Data, Climate Modeling, and Modern Observations that 2°C Global Warming Could be Dangerous. *Atmospheric Chemistry and Physics*. 16. pp. 3761–3812.

<sup>22</sup> C. F. Schleussner et al. 2016. Differential Climate Impacts for Policy-related Limits to Global Warming: The Case of 1.5°C and 2°C. *Earth System Dynamics*. 7. pp. 327–351.

<sup>23</sup> Organisation for Economic Co-operation and Development. 2008. *Environmental Outlook to 2030*. Paris.

<sup>24</sup> Examples drawn from Intergovernmental Panel on Climate Change (IPCC). 2014; World Bank. 2012.

would be normal, affecting nearly 90% of the region from June to August. New heat level peaks would gain in frequency.

- Coral reefs have suffered greatly over the past few decades from increased sea surface temperature. Annual bleaching, as early as 2030, can be predicted under just a 1.5°C warming. Acidification will also threaten corals as chemical stress damages reefs. This has significant impacts on fish stocks. Indeed, reports in April 2016 indicate massive parts of the Great Barrier Reef suffering from bleaching.
- South Asia is projected to face significant water supply crises. The annual mean monsoon levels will increase by 10%, with a 15% increase in variability, making the monsoon both stronger and less predictable.
- South Asia should have a 60% increase in crop production without climate change, but under just a 2°C rise, the more likely scenario is food imports needing to double to meet caloric needs. Decreasing food availability in 2050 is projected to cause a 35% increase in childhood stunting as undernourishment worsens.

Sea-level rise and storm surge are already affecting many communities in the region.

- Pacific island countries:<sup>25</sup>
  - The lowest-lying atoll states including the Marshall Islands, Tuvalu, and Kiribati will suffer profound impacts including disappearing in the worst-case scenario. The Federated States of Micronesia, Nauru, and Tonga could have major segments of their populations displaced. Under 4°C warming, for example, populations exposed are the Marshall Islands (93%), Tuvalu (81%), Kiribati (77%), and the Maldives (73%). Limiting warming to 2°C would dramatically reduce exposure, particularly for Kiribati by 48% and the Maldives by 42%.
  - Impacts from sea-level rise, storm surge, changes in water availability, seawater intrusion leading to soil degradation, ocean warming, and acidification will impact all of the Pacific DMCs (as well as the Maldives) much more severely than most other DMCs.
  - Massive investments, relative to national economies, are already being required by Pacific DMCs to adapt to the impacts of climate change—investments that otherwise would not be required such as seawalls, revamping water supplies to protect from storm surges, elevating houses and buildings, etc. Economic impacts from reduced crop production, loss of tourism income, and loss of fisheries will accelerate in the coming decade.
- Other countries:<sup>26</sup>
  - The six most at-risk countries (as measured by total 2010 population on threatened land) and nine of the 10 most at-risk countries (as measured by population) are in Asia (74% of the global population on implicated land lives in Asia as compared with 59% of global population inhabiting Asia).
  - Among all countries, the PRC has the most to lose from BAU, with 145 million citizens today on implicated land under 4°C warming. The PRC also has the most to gain from limiting warming to 2°C, which would cut the total to 64 million. Seven other DMCs have more than 10 million people living on implicated land— India, Bangladesh, Viet Nam, Indonesia, the Philippines, Thailand, and Myanmar, in descending order of total threats. A carbon path that limits warming to 2°C would reduce exposure by half or more (except Viet Nam with a 44% reduction).
  - Asia’s coastal cities, which largely drive their national economies, and have a major role in the global economy, are particularly at risk. Global megacities with the top 10 populations in the balance include Shanghai; Hong Kong, China; Kolkata; Mumbai; Dhaka; Jakarta; and Ha Noi. Global warming of 4°C could lead to submergence of land inhabited by more than half the populations of Shanghai, Mumbai, and Ha Noi.
- Several Asian countries will suffer severe water shortages. For example, the melting of glaciers in the Hindu Kush–Himalayas will completely change the flow patterns and availability of water in rivers that supply water and generate hydropower for over 1 billion people. Millions of people in low-lying coastal cities and deltaic zones across Asia will suffer impacts from sea-level rise, increased storm surges, and salinity intrusion into freshwater supplies; indeed, this is already happening in several countries.
- Some DMCs’ natural resource base, which provides the raw materials for industry, housing, and sustenance, and is the base for tourism, is already experiencing increased stress as a result of climate change.

<sup>26</sup> B.H. Strauss, S. Kulp and A. Levermann, 2015. *Mapping Choices: Carbon, Climate, and Rising Seas, Our Global Legacy*. *Climate Central Research Report*. pp. 1–38.

There is an increasing number of studies in the region which are intended to facilitate a better understanding of what and where climate impacts will occur in order to assist governments, communities, and the private sector to take adaptive measures. A joint study conducted by ADB, the World Bank, and Japan International Cooperation Agency in 2010 focused on urban vulnerabilities to flooding and water shortages.<sup>27</sup> A more recent study conducted by the United States Agency for International Development is a good example of downscaling models to understand a wide range of impact types in a more narrow geographic zone—the study looked at climate change and water resources, food security, livelihoods, and biodiversity in the Lower Mekong River Basin (LMB) (Box 3).<sup>28</sup>

### Box 3. Downscaling Climate Impact Studies under Different Climate Scenarios

A study conducted by the United States Agency for International Development (USAID) identified highly vulnerable and valuable agricultural and natural systems assets in the Lower Mekong River Basin (LMB) and projected 2050 impacts of a 4°C end-of-century climate change scenario. Climate threat modeling results were used to identify hot spots, i.e., areas affected by the greatest change in temperature or rainfall during the wet and dry seasons or the greatest change in flooding during the year. Most hot spots are located in northern Thailand; the northern Annamites of the Lao People's Democratic Republic (Lao PDR) and Viet Nam; the Srepok, Sesan, and Sekong river basins in the southeast LMB; and in the Delta. The five highest-ranked provinces were Chiang Rai in Thailand; Gia Lai and Kien Giang in Viet Nam; Khammouan in the Lao PDR; and Monduliri in Cambodia.

Some of the site-specific conclusions from the study show that, by 2050,

- The entire area may experience increased cyclone intensities with increased precipitation during storms leading to increase runoff and flows in the Mekong mainstream and its tributaries.
- 30% of the LMB will experience temperature increases greater than the 2.5°C threshold at which the Intergovernmental Panel on Climate Change has identified that plant and animal species are likely to be at an increased risk of extinction. By 2050, the largest increases in temperature will occur to the southeast of the LMB with some areas projected to have an increase of over 4°C. Provinces in Cambodia and Viet Nam are projected to experience large increases in temperature. In the Mekong Delta of Viet Nam and Cambodia, average maximum daily temperature increases in the wet season will be especially significant, ranging from 1.7°C to 5.3°C. Dry season temperatures will increase from 1.5°C to 3.5°C.
- Annual precipitation is projected to increase by 3%–18% throughout the basin. This will mostly be due to increases in wet season rainfall. Southern parts of the LMB will experience increased seasonal variability in rainfall, with wetter wet seasons and dryer dry seasons which, when combined with higher temperatures, will have especially significant effects on species and ecosystems. Provinces in the Lao PDR and Thailand will experience large increases in precipitation. Chang Rai province in Thailand is projected to experience some of the largest relative increases in precipitation with annual precipitation increasing by 9%–18%.
- Flash flooding and soil loss in upland areas are expected to become more frequent. Kien Giang in southern Viet Nam will experience the greatest change in flood duration in the Delta from both seaward and upstream influences.
- Shifts in extreme climate events, such as drought, flooding, flash floods, and storms, will lead to permanent ecosystem changes.
- The period of agricultural drought per year is likely to significantly increase in large areas in the south and east of the LMB by 2050. Projections for severe droughts are centered on Northeast Khorat plateau in Thailand, but the largest increases in drought will occur in the Mekong floodplain in Cambodia and southern Lao PDR.
- Saltwater intrusion of the Delta will become more intense due to increasing sea levels and storm surge. Projected changes in salinity intrusion under a 30-centimeter sea-level rise during 2045–2069 are expected to be moderate during the wet season but significantly more severe during the dry season. Maximum salinity concentration is projected to increase by more than 50% compared with the reference, affecting more than 133,000 hectares.

The poor are the most at risk to the impacts of climate change. Climate change brings more intense and frequent climate hazards/disasters; expands climate-related diseases, increasing health risks; and impacts on agricultural productivity, threatening food security and affecting the poor and undernourished who are more exposed and vulnerable to these impacts.

Climate change threatens poverty alleviation objectives. According to a recent World Bank study, climate change could push more than 100 million people into extreme poverty, with the agriculture sector as the key driver, and most impacts may be mitigated with rapid, inclusive, and climate-informed development.<sup>29</sup> And, this entails an integrated strategy targeting climate-resilient measures (e.g., climate-smart agricultural practices) and providing social safety nets, and universal health care for the poor. Social safety nets (e.g., cash transfers, insurance products, etc.) help the poor prepare for and manage the impacts of climate change.

## B. Economics of Climate Change

In a series of studies, ADB assessed the associated economic costs of climate change for its operational regions, and found that the cost of inaction on climate change is greater than the cost of action (Box 4).<sup>30</sup> Adaptation can make a substantial contribution to reducing the damages but would not be sufficient on its own. Minimizing the losses also requires emissions abatement to slow and, eventually, reverse the accumulation of GHG in the atmosphere.<sup>31</sup>

### Box 4: Economics of Climate Change in Asia and the Pacific

- In Southeast Asia, inaction in Indonesia, the Philippines, Thailand, and Viet Nam could result in a loss equivalent to more than 6% of gross domestic product (GDP) annually by 2100, more than double the global average loss while adaptation at a cost of just 0.2% of GDP for investment in such things as seawalls and drought- and heat-resistant crops, could avoid damages amounting to 1.9% of GDP, on an annual basis.
- In East Asia, under business-as-usual (BAU) scenario, if current patterns of development continue, the average losses due to climate change could amount to 5.3% of annual GDP by 2100. With adaptation at expected cost of 0.4% of GDP, residual damages would amount to 1.6% of GDP on average by 2100.
- In South Asia, without global deviation from a fossil-fuel-intensive path (BAU), losses for the region could amount to an equivalent 1.8% of annual GDP by 2050, which will progressively increase to 8.8% by 2100. Avoiding the damages and economic losses under BAU scenario would require an average adaptation expenditure of 0.48% of GDP per annum by 2050 and 0.86% of GDP per annum by 2100. If actions are taken to keep the global mean temperature rise at or below 2°C, the region would lose an average of 1.3% of GDP by 2050 and roughly 2.5% by 2100, with associated costs of 0.36% of GDP per annum by 2050 and 0.48% of GDP per annum by 2100.
- In the Pacific, if the world were to stay on the current fossil-fuel intensive growth model, total climate change cost in the region is estimated to reach 12.7% of annual GDP equivalent by 2100. Under this BAU scenario, the region would require on average approximately 1.5% of GDP (which could get as high as 2.5% of GDP) every year until 2050 to prepare for the worst case (95th percentile) of climate change. If global warming is maintained at approximately 2°C, the economic cost would be smaller but still would reach between 2% and 3% of GDP by 2100 while adaptation is expected to be as low as 0.5% of GDP per annum.

## IV. REGIONAL ASSESSMENT OF INTENDED NATIONALLY DETERMINED CONTRIBUTIONS

This section presents an initial review of the INDCs of ADB's DMCs. The analysis is structured to support an understanding of ADB program and pipeline alignment with DMCs' stated commitments. Table 2 presents the summary checklist of DMC INDCs, while Appendix 2 provides the details on the INDC targets, priority measures, and financing requirements in relation to ADB focus areas for the ADB operational regions. As discussed in subsection C, many of the mitigation actions proposed in several DMC INDCs are conditional upon access to additional and concessional finance. More than half of the INDCs (55%) have provided combined conditional and unconditional targets. A large proportion (68%) has indicated mitigation contributions in terms of GHG emission reduction. On sector information, more than half of the INDCs indicated key measures on agriculture and natural resources, energy, and transport. Further, about 76% of INDCs have indicated adaptation targets/measures, while only 42% have specified estimates on financing needs for the implementation of the INDCs.

**Table 2: Checklist on Intended Nationally Determined Contributions of ADB Developing Member Countries**

ADB = Asian Development Bank, DMC = developing member country, GHG = greenhouse gas, INDC = intended nationally determined contribution.

a Uzbekistan in Central and West Asia and Timor-Leste in the Pacific are excluded as both have not submitted an INDC at the time of writing.

b Cost estimates are preliminary or partial and derived from key mitigation and adaptation measures identified in the INDCs, and may not account for all expected costs of necessary measures.

Source: ADB.

## A. Mitigation Contributions

The target mitigation contributions of the DMCs are set in various terms. For most of the DMCs (68%), mitigation contributions were expressed in terms of reduction in GHG emissions. A few have also indicated targets in terms of increased use of renewable energy (29%), enhanced energy efficiency (5%), carbon/GHG emission intensity (13%), and carbon neutral/ecosystem neutral GHG emissions (5%). The discussions in this subsection will focus on intended mitigation contributions in terms of reduction in GHG/carbon emissions or emission intensity, in each of the ADB operational region.

### 1. Central and West Asia

In Central and West Asia, six of the nine DMCs in the region specified an intended mitigation contribution target in terms of percentage reduction in GHG emissions. Afghanistan, Azerbaijan, Georgia, Kazakhstan, the Kyrgyz Republic, and Tajikistan aim at GHG emission reduction ranging from 11.49 to 90% by 2030, compared with BAU (for Afghanistan, Georgia, and the Kyrgyz Republic), or to 1990 level (for Azerbaijan, Kazakhstan, and Tajikistan). Georgia also expressed its targets in terms of reduction in emission intensity.

Armenia, Pakistan, and Turkmenistan did not specify a GHG emission reduction target. Armenia has set a target on total aggregate emissions (at 633 million tons carbon dioxide equivalent [ $tCO_2e$ ]) for the period 2015–2050 and

commits to strive in achieving ecosystem neutral GHG emissions in 2050. On the other hand, Pakistan committed to reduce its emissions after reaching peak levels, and indicated that it could only make specific commitments once reliable data on peak emission levels are available. Both Armenia and Pakistan mitigation commitments are conditional on international assistance. For Turkmenistan, it expects the stabilization of GHG emissions by 2030, and commits to reducing energy/carbon/GHG emission intensity after 2030. Additionally, Turkmenistan is of view that the baseline scenario ensures sustainable economic development, with GHG emissions growth far behind gross domestic product (GDP) growth rate, and reduction of GHG emissions will be at the expense of its own financial resources. As such, financial and technological support from developed countries is necessary to reduce emissions, and could help the country achieve zero growth in emissions and even reduce them up to 2030.

## 2. East Asia

In East Asia, both the PRC and Mongolia specified a target reduction in emissions or emission intensity by 2030. The PRC aims to reduce its carbon intensity in terms of its GDP by 60%–65% (compared with 2005 level), while Mongolia aims at a percentage reduction of GHG emissions by 14% (compared with BAU). The PRC additionally intends to achieve peaking of carbon dioxide (CO<sub>2</sub>) emissions around 2030, with best efforts to peak early.

## 3. Pacific

Of the 13 Pacific DMCs, 11 have provided intended mitigation contributions in terms of percentage reduction in GHG emissions. Fiji, Kiribati, the Federated States of Micronesia, the Marshall Islands, and Solomon Islands have set an intended economy-wide GHG emission reduction target ranging from 12% to 49% compared with BAU/2000/2010/2015 levels. The Cook Islands, Palau, Papua New Guinea, Tonga, Tuvalu, and Vanuatu have set energy/electricity sector-specific GHG emissions targets, with Papua New Guinea, Tuvalu, and Vanuatu aiming at carbon-free electricity sector or at 100% emission reduction and/or 100% renewable electricity generation. For these six DMCs, targets are compared with BAU/2005/2006/2010 levels. All targets have components conditional on receiving international/external financing and technical support.

Samoa committed to reduce GHG emissions from the electricity sector, with a 100% renewable energy target for electricity generation through 2025, compared with 2014. This target is conditional on reaching 100% renewable electricity generation in 2017 and receiving international assistance to maintain contribution through 2025.

Nauru's INDC did not indicate a GHG emissions target, but specified unconditional contribution for implementation of 0.6 megawatt (MW) solar photovoltaic (PV) system to assist in unconditional reduction of CO<sub>2</sub> emissions marginally, which will serve as a model project facilitating institutional learning and technology transfer. It also specified a target on replacement of existing diesel-operated plants with large-scale, grid-connected solar PV system and improvements on demand-side energy management; however, these are conditional on provision of substantial technical, capacity building, and logistical assistance.

## 4. South Asia

Except for Bhutan and Nepal, South Asia DMCs provided intended mitigation contribution in terms of percentage reduction in GHG emissions or emission intensity. Bangladesh, the Maldives, and Sri Lanka aim at GHG emission/carbon intensity reduction ranging from 5% to 24% by 2030, from BAU, with components conditional on international assistance. India commits to reduce emission intensity by 33% to 35% by 2030 compared with 2005. While not providing a specific GHG emission reduction commitment, Bhutan stated intention to remain carbon neutral where GHG emissions will not exceed carbon sequestration by the forests. On the other hand, Nepal's stated commitments were in terms of reduction in fossil fuel dependency, appropriate mix of renewable energy in energy mix, and maintained forest cover.

## 5. Southeast Asia

DMCs in Southeast Asia, except the Lao People's Democratic Republic (Lao PDR) and Myanmar, provided intended mitigation contributions in terms of percentage reduction in GHG emissions or emission intensity. Cambodia, Indonesia, the Philippines, Thailand, and Viet Nam aim at GHG emission or emission intensity reduction ranging

from 8% to 70% by 2030, compared with BAU, with components conditional on international assistance. Malaysia commits to reduce GHG emission intensity by 45% by 2030, relative to 2005, with a component conditional on climate finance, technology transfer and capacity building support.

The Lao PDR and Myanmar did not specify a target in terms of GHG emission or emission intensity reduction. However, the Lao PDR specified undertaking a number of actions to reduce its future GHG emissions, subject to the provision of international support. These actions cover renewable energy development, rural electrification, transportation-focused Nationally Appropriate Mitigation Actions (NAMAs), and hydroelectricity plans. Similarly, Myanmar also provided a list of actions focused on the energy and forestry sectors to reduce GHG emission. These actions are contingent on support for capacity building, technology development and transfer, and financial resources from the international community, as well as the active participation of the national and international private sector.

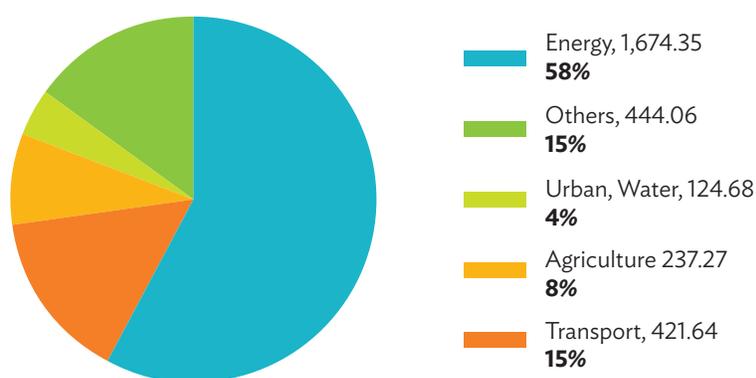

## B. Sectoral Climate Actions/Priorities

As discussed in Section 2, a number of INDC analyses have indicated that the current INDCs are insufficient to reach the 2°C or even 1.5°C global warming limit. There is a need to determine where further emission cuts could be made to inspire increased level of ambition and move closer to achieving the global climate goal. An initial step is to assess the sectoral climate measures that have been identified in the INDCs.

A recent study analyzed INDCs (from 16 countries and the EU-28), and investigated on the levers countries prioritize to reduce emissions and what opportunities exist for further reduction.<sup>32</sup> Among others, it finds that expanding zero-carbon electrical sources of energy is the most clearly specified emission reduction lever in current INDCs. A massive renewable electrical energy is also expected. Further, there are very limited measures to decarbonize energy supply beyond the power sector such as in transport, building, and industry; and addressing nonenergy-related emissions could help countries achieve their targets.

For ADB's DMCs, climate measures in the agriculture and natural resources, energy, and transport sectors are the most common priorities identified in the INDCs, while in fewer DMCs, measures in the urban, water, and industry and trade sectors were also indicated as priorities. Historically, ADB's climate finance has been aligned with these priorities. The following figure presents ADB's sectoral climate investments in 2015. The discussions that follow inform on the measures for each of ADB's operational regions.

**ADB Climate Finance by Sector, 2015 (\$ million)**

Note: "Others" aggregates figures from the public sector management, education, and finance sectors.

Source: ADB estimates.

<sup>32</sup> Energy Transition Commission. 2016. Pathways from Paris: Assessing the INDC Opportunity. <http://www.energy-transitions.org/sites/default/files/20160426%20INDC%20analysis%20vF.pdf>

## 1. Central and West Asia

The INDCs in the Central and West Asia placed sectoral priorities on agriculture and natural resources, energy, transport, and water. Climate actions/measures in the urban and industry and trade sectors were also covered in some DMCs.

- Agriculture and Natural Resources – Sustainable forest management, in particular regeneration of degraded forests, afforestation/reforestation, and forest protection, were identified as priority measures in the INDCs of Afghanistan, Armenia, Azerbaijan, Georgia, and Tajikistan. Development of sustainable agricultural/irrigation systems is also a priority action specifically for Afghanistan, Georgia, and Tajikistan. Adaptation in the agriculture sector is also a priority in Turkmenistan’s INDC.
- Energy – The use of alternative and renewable energy is a common priority in the INDCs, particularly for Afghanistan, Armenia, Azerbaijan, Tajikistan, and Turkmenistan. Meanwhile, energy efficiency/conservation measures were covered in the INDCs of Armenia, Azerbaijan, and Turkmenistan.
- Transport – The INDCs of Afghanistan, Armenia, Azerbaijan, Tajikistan, and Turkmenistan indicated priority mitigation/energy efficiency measures relating to the transport sector, such as the development of electrical vehicles or environment-friendly forms of transport, and metro transport; and electrification of railway lines. Tajikistan highlighted priority on full-scale integration of climate resilience and adaptation measures into the planning and development of green transport infrastructures.
- Water – The priority measures, as covered in the INDCs of Afghanistan, Armenia, Georgia, Tajikistan, and Turkmenistan, were mainly on sustainable water resources management.
- Urban development – Covered in Afghanistan, Armenia, and Azerbaijan, the common measure identified is on waste management, i.e., wastewater and solid waste.
- Industry and trade – Afghanistan and Armenia have identified measures for this sector, such as measures on industrial processes and mining. Tajikistan and Turkmenistan have also identified this as a key sector in their INDC.

In the area of environment, climate change, and disaster risk management, the Central and West Asia INDCs, particularly for Afghanistan, Armenia, Georgia, and Tajikistan, highlighted priority on adaptation actions add/or disaster risk reduction and management. Some of the key intentions highlighted in the INDCs are as follows:

- Afghanistan - focus on the development and adaptation of a climate change strategy and action plan as well as development of a system to monitor and assess vulnerability and adaptation to climate change. Afghanistan also aims to strengthen meteorological and hydrological monitoring systems.
- Armenia - adaptation activities based on most vulnerable sectors such as natural ecosystems (aquatic and terrestrial, including forest ecosystems, biodiversity and land cover), human health, water resources management, agriculture (including fisheries and forests) energy, human settlements and infrastructures, and tourism, will be prioritized.
- Georgia - establishment of early warning systems for climate-related extreme events will be a key measure.
- Tajikistan - disaster risk reduction, modernization of hydrometeorological services, and the full-scale integration of climate resilience and adaptation measures into planning and development of green infrastructures will be key climate actions.
- Turkmenistan - focus on measures developing preventive programs to reduce adverse effects of climate change and adaptation to extreme changes of weather conditions. Adaptation measures will focus on the following sectors: water, agriculture, soil and land resources, and ecosystems.

## 2. East Asia

In East Asia, the PRC and Mongolia have common priorities on the agriculture and natural resources, energy, and transport sectors but have differing priorities on urban and water development, and industry and trade.

- Agriculture and natural resources – Sustainable forest management/strengthened forest disaster prevention (i.e., reduced deforestation/forest degradation, reforestation activities, enhanced forest climate resilience), and low-carbon and climate-resilient agriculture (irrigation, cultivation, crop rotation, livestock/pasture management) are the priority measures.
- Energy – the promotion of renewable energy (i.e., wind, solar, hydropower) and improved energy efficiency in buildings and coal-fired heating/thermal power plants are the common priorities.
- Transport – The PRC will focus on developing green and low-carbon transport system, improving quality of fuels and alternative fuels, and advocating green travel (i.e., dedicated system for pedestrians and bicycles). On the other hand, Mongolia will prioritize improvement of road networks, increased use of hybrid vehicles, development of bus rapid transit, and shift to liquefied petroleum gas. Both the PRC and Mongolia will also prioritize promotion/improvement of public transport.
- Urban development – The PRC will prioritize the optimization of urban system and space layout including integration of low-carbon development in urban development, while Mongolia will prioritize the development of a waste management plan including recycling, waste-to-energy development, and best management practices.
- Water – The PRC will focus on enhancing climate resilience of water operations and infrastructures and optimized allocation of water resources, while Mongolia will aim to invest on integrated water resources management, creation of water reservoirs and multipurpose systems of water use, and solutions for sustainable water supply.
- Industry and trade – Building energy-efficient and low-carbon industrial system will be a key measure for the PRC, while Mongolia has indicated a focus on reduced emissions in the cement industry.

On environment, climate change, and disaster risk management:

- People's Republic of China – prioritizes the strengthening of strategies, laws, and regulations, and development planning on climate change as well as its implementation, promotion of low-carbon development growth and way of life, enhancement of overall climate resilience, improvement of information relating to climate change (e.g., fundamental research on climate change, research and development on low-carbon technologies and early warning systems, GHG statistics and accounting systems, etc.), and promotion of carbon emission trading market.
- Mongolia – focus on strengthening of early warning systems for disasters from natural hazards. Mongolia will establish early detection and prediction system, conduct disaster risk assessments at local and subnational levels, improve forecast quality through increasing super computer capacity, and establish Doppler radar network covering entire territory of the country.

### 3. Pacific

For the Pacific region, energy, transport, and agriculture and natural resources are the key sectors in the INDCs. Urban development and water are covered in few DMCs.

- Energy – a key sector in all INDCs of the Pacific DMCs. The promotion of renewable energy (i.e., solar energy for almost all DMCs, and wind, hydropower, biomass/bioenergy, and geothermal for a selected number) is a common priority. For Fiji and the Marshall Islands, the potential for transformational technologies, such as ocean and wave energy, will also be explored. Further, the DMCs will combine renewable energy measures with energy efficiency and conservation measures in achieving the intended mitigation targets. Nauru and Samoa have specified demand-side energy improvements, while the Marshall Islands and Tonga have specified both supply- and demand-side energy efficiency improvements.
- Transport – The Cook Islands, Kiribati, the Marshall Islands, Palau, Papua New Guinea, and Tonga prioritize development of low-carbon transport technologies. The use of biodiesel from coconut oil or conversion of cooking oil to biofuel for use in vehicles, introduction of electric/solar-charged vehicles, and improvement of public transport through introduction of energy-efficient buses and other infrastructures/modes of transport have been specified as key measures.

- Agriculture and natural resources – Selected Pacific DMCs have also specified various priority actions on agriculture and natural resources. Cook Islands will focus on reduction of carbon emissions and strengthening of climate resilience through coastal protection, agriculture, forestry and marine conservation. Kiribati has indicated protection and sustainable management of mangrove resources and coastal vegetation and sea-grass beds as a key action. Nauru has indicated priority actions on agriculture and land management and rehabilitation. Papua New Guinea has identified reducing emissions from deforestation and forest degradation plus (REDD+) activities as a priority. Both Solomon Islands and Vanuatu have identified agriculture and food security as an adaptation priority area. For Vanuatu, additional priorities include sustainable forest and livestock farming management, land-use planning and management, and development of climate-resilient corps. For Tonga, the improvement in soil management, development of agro-forestry systems, and use of biogas systems, as well as improvements in animal welfare, will be prioritized for the enhancement of climate resilience of agriculture. Tuvalu has specified emission reduction from agriculture and waste as a key conditional target.
- Urban development – Planned actions on waste management, for reduction of methane emissions or as an adaptation priority, are identified in the INDCs of the Marshall Islands, Palau, and Solomon Islands.
- Water – Cook Islands, Nauru, Solomon Islands, and Vanuatu have identified the water sector as an adaptation priority, specifically to address water sanitation and security and implementation of integrated water resources management.

On environment, climate change, and disaster risk management, Pacific DMCs have generally provided high priority on increased resilience through adaptation and/or disaster risk reduction.

- Cook Islands – focus on building resilience including coastal protection, water security, agriculture, forestry, marine conservation, waste, tourism and land management.
- Fiji – focus on development of integrated approach to addressing climate change, ensuring cyclone-resistant buildings are constructed, strengthening of governments and partnerships in building resilience, enhancement of understanding on climate change impacts, ensuring that mitigation and adaptation are incorporated in national and subnational development planning and budgetary process; and increasing resources for climate change measures.
- Kiribati – seeks increased resilience through sustainable climate change adaptation and disaster risk reduction. This includes increasing water and food security and promoting healthy and resilient ecosystems; delivering appropriate education, training and awareness programs; promoting sound and reliable infrastructure development and land management; increasing effectiveness and efficiency of early warning systems and disaster emergency management; strengthening of governance, policies, and legislation; enhancement of knowledge and information generation, management and sharing; strengthening and greening of the private sector; strengthening capacity to access finance, monitor expenditures and maintain strong partnerships; strengthening health service delivery to address climate change impacts; and enhancing the participation and resilience of vulnerable groups.
- Marshall Islands – will further develop and enhance the adaptation framework to build upon disaster risk management strategies, including through development and implementation of a national adaptation plan, protecting traditional culture and ecosystem resources, ensuring climate-resilient public infrastructure, and pursuing facilitative, stakeholder-driven methods to increase resiliency of privately owned structures and resources.
- Nauru – adaptation priority actions targeting the following areas: water, health, agriculture, energy, land management and rehabilitation, infrastructure and coastal protection, biodiversity and environment, community development and social inclusion, and education and human capacity development, which also contribute to overall goals of the National Sustainable Development Strategy. Nauru will also address information gaps, vital for planning and management, and strengthen institutions.
- Solomon Islands – priority adaptation measures in priority sectors provided in the National Adaptation Programme of Action (NAPA) including agriculture and food security, water and sanitation, human settlements and human health, education awareness and information; low-lying and artificially built-up islands; waste management; coastal protection; fisheries and marine resources, infrastructure development and tourism.

- Tonga - aims at a holistic approach in addressing adaptation, mitigation, and disaster risk reduction through mainstreaming resilience in legislation, policies, and planning; coordinated approach in data/info research, monitoring, and management; capacity development on resilience-building responses; and implementation including financing of climate resilience actions.
- Vanuatu - NAPA identified priorities including agriculture and food security, sustainable tourism development; community-based marine resource management, sustainable forest management, and integrated water resource management. The mainstreaming of climate change and disaster risk reduction has been identified, among others, as a NAPA core issue and an integral part of climate activities.

#### 4. South Asia

In the South Asia region, agriculture and natural resources, energy, and transport are the key sectors in all six INDCs, while the urban development, water, and industry and trade sectors were covered in selected INDCs.

- Agriculture and natural resources - Sustainable forest management for the increase in or maintenance of forest cover and enhanced climate resilience of the agriculture sector through climate-friendly technologies are key priority actions in the INDCs.
- Energy - The focus on development and promotion of renewable energy (i.e., solar, wind, hydro, and biomass) is common for all INDCs. Actions to enhance energy efficiency in appliances, buildings, and industrial/commercial processes were also provided in selected INDCs such as in Bangladesh, Bhutan, India, and Sri Lanka.
- Transport - The development and promotion of low-carbon/energy-efficient transport system (e.g., bus rapid transit systems, nonmotorized and nonfossil fuel-powered transport, electric railway system) is also a common action in most of the INDCs.
- Urban development - Climate measure focusing on reduction of emissions from sustainable waste management, as covered in the INDCs of Bangladesh, Bhutan, India, and Sri Lanka.
- Water - Common climate measures focus on integrated water resources management to address water security and water supply disturbances, as covered in Bhutan, the Maldives, and Sri Lanka INDCs.
- Industry and trade - Common climate measures, in particular for Bangladesh, Bhutan, India, and Sri Lanka, are focused on energy efficiency and conservation through promotion of policies, incentivizing uptake, and improvement of processes.

In the area of environment, climate change, and disaster risk management, the building or strengthening of climate-resilient infrastructures and/or enhancement of disaster risk management, including climate-proofing of infrastructures and improved disaster preparedness and response, were covered in all INDCs. In the Bangladesh, Bhutan, India, Nepal, and Sri Lanka INDCs, enhanced knowledge/understanding on climate change, impacts, loss, and damages, through study, research, enhanced information services, and knowledge management are highlighted.

- Bangladesh - priorities and measures include capacity building on planning and implementation of adaptation programs and projects, comprehensive disaster management (e.g., improved early warning systems, disaster preparedness and construction of flood/cyclone shelters), and building of climate-resilient infrastructure (e.g., flood-proofing, climate-resilient housing). Research and knowledge management is an adaptation priority.
- Bhutan - focus is on strengthening climate change resilience, enhancing climate change information services and integration of climate-resilient and low-emission strategies in urban and rural settlements.
- India - will develop climate-resilient infrastructure, and plan and implement actions enhancing climate resilience and reducing climate vulnerability. It will enhance investments in development programs for the vulnerable sectors, which includes agriculture, water resources, Himalayan region, coastal regions, health, and disaster management. It will build capacities and develop frameworks to enable diffusion of cutting-edge climate technology and joint collaborative research and development for future technologies.
- Maldives - will increase resilience and climate proofing of all critical infrastructures and facilitate integration of climate change into development planning. It will enhance early warning and systematic observation (e.g., expanding and strengthening the meteorological network and weather-related early warning systems, improving climate forecasting, developing risk management tools).
- Nepal - prioritizes adaptation and building of resilience to climate change impacts. Climate change

adaptation is placed at the center of development plans and policies. The country intends to undertake scientific approaches to understand and deal with climate change impacts, for the development of adaptation strategies.

- Sri Lanka – aims at the mainstreaming of climate change adaptation into national planning and development, enabling climate-resilient and healthy human settlements, minimizing climate impacts on food security, improving climate-resilience of key economic drivers, and safeguarding natural resources and biodiversity. It will also improve forecasting capabilities and analyze loss and damages of climate-induced disasters.

## 5. Southeast Asia

Agriculture and natural resources, and energy are the key sectors in the Southeast Asia INDCs.<sup>33</sup> Transport and urban development are covered in most INDCs, while a few covered water and industry and trade.

- Agriculture and natural resources – The increase of forest cover is a specified target for Cambodia, the Lao PDR, Malaysia, and Myanmar. Aligned with this target, sustainable forest management and the restoration and rehabilitation of the forests (afforestation/reforestation) are common prioritized activities in the INDCs. The promotion of sustainable agriculture and climate-resilient/climate-proof farming systems and agriculture infrastructures are also priority actions in the INDCs.
- Energy – The development and promotion of renewable energy (e.g., solar, hydropower, biomass, biogas, and wind) is a common priority in the INDCs. The promotion of end-use energy efficiency was specified in the INDCs of Cambodia (in particular, in buildings and households), Indonesia, Myanmar (energy-efficient cookstoves), Thailand, and Viet Nam (in residential, trade, and services). Key to these energy priorities is the enhancement of the policy and regulatory environment (Viet Nam and Myanmar) and the creation of incentive mechanisms for technology development (Thailand).
- Transport – The promotion of low-carbon/energy-efficient road transport system such as through mass public transport (rail-based, bus); increased use of hybrid cars, e-vehicles, and bicycles; modal shift for freight and passenger transport; and use of compressed natural gas and liquefied petroleum gas are priority actions in the INDCs, notably for Cambodia, the Lao PDR, Malaysia, Thailand, and Viet Nam.
- Urban development – Sustainable urban development is a priority in the INDCs of Cambodia, Indonesia, the Lao PDR, Myanmar, Thailand, and Viet Nam. Enhanced waste management is a common priority for Cambodia, Thailand, and Viet Nam. Indonesia aims at climate-resilient cities as one of its enhanced actions to support ecosystem and landscape resilience, while the Lao PDR will work at increasing climate resilience of urban infrastructures. Myanmar will ensure that increasing urbanization takes place in a sustainable manner.
- Water – For adaptation and increased climate resilience as well as ensured water security, the Lao PDR, Malaysia, Myanmar, Thailand, and Viet Nam have identified priorities in the water sector, focusing on water resources management, including strengthening of regulatory frameworks and information systems, infrastructure development, and enhanced cooperation on transboundary water issues.
- Industry and trade – Cambodia has identified the promotion/adoption of renewable energy and energy-efficient technologies for garment factories, rice mills, and brick kilns as priority, while Myanmar has identified the industry sector as an adaptation priority.

In the area of environment, climate change, and disaster risk management, the common priority actions for Cambodia, Indonesia, Malaysia, the Philippines, Thailand, and Viet Nam are the strengthening of disaster risk management and improvement on disaster preparedness and response, e.g., early warning systems, flood mitigation programs. Also, the integration/mainstreaming of climate change in policies, development plans/programs/strategies is a priority for Cambodia, Indonesia, the Lao PDR, Malaysia, Myanmar, the Philippines.

- Cambodia – priority actions include building the adaptive capacity of communities; implementing management measures for protected areas; strengthening early warning systems and climate information dissemination; developing and/or rehabilitating flood protection dykes; promoting climate-resilience in agriculture, including climate-proofing of agricultural systems, developing crop varieties, promoting

<sup>33</sup> The Philippines did not specify climate activities that could be associated to a specific sector although the INDC noted that the reduction in carbon dioxide equivalent (CO<sub>2</sub>e) emissions will come from the energy, transport, waste, forestry, and industry sectors.

aquaculture production systems, building sea dykes, and scaling-up of climate-smart farm systems; upscaling of national health programs in disaster-prone areas; and strengthening capacity to conduct climate impact assessments and projections as well as mainstream climate change in development plans.

- Indonesia – focus on integrated, landscape-scale approach covering terrestrial, coastal, marine ecosystems; blending of traditional wisdom and innovations; mainstreaming climate agenda in development planning and programs; and promoting climate resilience in food, water and energy as well as improvement in natural resources management. This also includes enhancement in disaster preparedness, human settlements, provision of basic services and climate-resilient infrastructure development.
- Lao PDR – aim at increasing resilience against climate change and disasters of key economic sectors and natural resources; enhancing cooperation, strong alliances and partnerships with stakeholders and partners and improving awareness and understanding on climate change, vulnerabilities and impacts to enhance interest to take action. This includes development and implementation of integrated adaptation and mitigation solutions, i.e., that are low-cost, improve energy efficiency, promote cleaner production, and provide adaptation/mitigation synergies as well as economic, environmental and socioeconomic benefits.
- Malaysia – adaptation focus on addressing flood risks, water security, food security, and protecting coastlines and health. This includes implementation of flood mitigation programs; strengthening of disaster risk management and resilience of infrastructures; and strengthening of regulatory framework, expanding supply network and treatment capacity infrastructure, and increasing efficiency of the water services.
- Myanmar – prioritizes adaptation and disaster risk reduction, in particular, agricultural sector resilience, early warning systems development, forest preservation measures, public health protection, water resources management, coastal zone protection, resilience in energy and industry sectors and biodiversity preservation. It will focus on climate-resilient, low-carbon, resource-efficient, and inclusive development; mainstreaming of environment and climate change in development and reform agenda; strengthening of institution and policy environment; promotion of evidence-based planning and policymaking; increased climate change awareness; promotion of economic green growth; and monitoring of environment quality.
- Philippines – will mainstream climate change adaptation and disaster risk reduction in country planning and programming. Priority measures include institutional and system strengthening climate modeling, scenario-building, monitoring and observation; roll-out of science-based climate/disaster risk and vulnerability assessment process; development of climate-/disaster-resilience in ecosystems and key sectors such as agriculture, water and health; systematic transition to climate- and disaster resilient social and economic growth; and research and development for improved risk assessment and management.
- Thailand – priorities include safeguarding of biodiversity and restoration of ecological integrity in protected areas and landscapes; promotion of nature-based and sustainable tourism, strengthening of disaster risk reduction and reduction of vulnerability to climate risks and extreme weather events, strengthening of climate modeling capacity, establishment of effective early warning system and enhancement of the adaptive capacity of national agencies.
- Viet Nam – priority actions include strengthening of the state in responding to climate change; managing and developing of sustainable forest, enhancing of carbon sequestration and environmental services, conserving biodiversity; enhancing communication and awareness; enhancing international cooperation in scientific research and information exchange; responding proactively to disasters including improved climate monitoring; and ensuring social security through measures such as climate-appropriate livelihood development and strengthened insurance system.

### C. Financing Requirements

Finance has a key role in the implementation of the NDCs. A recent study reviewed the financial aspects of the INDCs and estimated total financing needs, based on the current INDCs, to roughly amount to more than \$4.4 trillion (or \$349 billion annually).<sup>34</sup> The study noted the importance of enhancing the financial aspects of future NDCs—improving comparability and transparency—and recommended for standardization or harmonization of

<sup>34</sup> L. Weischer et al. 2016. *Investing in Ambition: Analysis of the Financial Aspects in (Intended) Nationally Determined Contributions. Briefing Paper.* Germanwatch e.V. and Perspectives Climate Group: Bonn. <https://germanwatch.org/en/download/15226.pdf>

format and methodologies. It also highlighted that a key enabler to NDC implementation is the development of comprehensive financing strategies, which would outline the roles of domestic and international, public and private finance in support of meeting the commitments, as well as determine how market mechanisms may mobilize finance. This is another key area for international community support.

Almost all DMCs have provided commitments that are conditional (fully or partially) on provision of support in finance as well as capacity building, and/or technology transfer. However, of the DMCs that have provided indication on the financing requirements to implement their INDC, 16 DMCs (42%) have provided only preliminary or partial estimates and require better rationalization of financing needs to fully account the country's implementation requirements.

## 1. Central and West Asia

In Central and West Asia, only four of the nine DMCs provided an estimate of required financing to implement the mitigation/adaptation actions outlined in the INDCs. The Kyrgyz Republic, Georgia, and Turkmenistan provided partial/rough estimates, while Afghanistan provided an estimate based on adaptation/mitigation measures identified. The Kyrgyz Republic estimates are only on mitigation and based on GHG emission reduction scenarios presented. Georgia's and Turkmenistan's estimates cover only adaptation measures. For Georgia, the estimated adaptation total cost is based on expert judgment, and pre-2020 activities are planned to estimate the required financial support.<sup>35</sup> For Turkmenistan, the INDC indicated a preliminary estimate on costs covering adaptation measures; however, they are foreseen to be within the state budget.

The intended contributions and outlined mitigation and adaptation actions set out in the INDCs are dependent on international/developed country support on financing, capacity building, and technology transfer for most of the DMCs. Only Azerbaijan did not specify the need for external support, of note, its INDC did not provide much detail on means of implementation. Among those requiring support, Afghanistan's target GHG emission reduction is purely conditioned on external assistance. The GHG emission reductions for Georgia, Kazakhstan, the Kyrgyz Republic, and Tajikistan are partially unconditional and conditional. For Armenia, achievement of ecosystem neutral GHG emissions requires adequate (necessary and sufficient) international support. Turkmenistan has indicated that the means of implementation is primarily the state budget, and noted that the country's economy has the potential to further reduce GHG emissions. At a certain international support, Turkmenistan could achieve zero growth in emissions and even reduce them up to 2030.

Afghanistan, Kazakhstan, and Armenia have highlighted the need for access to climate financing in the INDCs. Afghanistan stated that it "requires the UNFCCC, the GEF, the GCF, and other international institutional arrangements to provide the extra finance and other support needed to successfully implement Low Emission Development Strategies across all sectors of its economy without compromising socio-economic development goals." Meanwhile, Kazakhstan's conditional target is "subject to additional international investments, access to low carbon technologies transfer mechanism, green climate funds and flexible mechanisms." Armenia intends to develop an appropriate legislative and institutional framework for adequate financial assistance that would consist of an external financial mechanism with resources from the GCF, Adaptation Fund, and the GEF; bilateral and multilateral funds; and other sources; and an internal (domestic) climate revolving civil fund, with allocations from environment/ecosystem services fees generated including carbon taxing.

## 2. East Asia

For East Asia, only Mongolia provided a preliminary indication and rough estimation on financing needs for the mitigation and adaptation measures outlined in the INDC. Mongolia has indicated intention to seek international funding, as well as capacity building and technology support, to complement its domestic resource allocations and efforts. Mongolia is interested in opportunities to access international climate funds, namely the GCF and participation in crediting mechanisms to implement the measures. While a preliminary estimate has been provided, Mongolia will still articulate its specific needs on mitigation and communicate the potential supporting

<sup>35</sup> These activities include (i) prioritizing selected adaptation policies and measures based on national circumstances and identify associated financial needs, (ii) evaluating domestic sources of finances, and (iii) determining need and sources for external financial support.

role of international community. On adaptation measures, Mongolia expressed that about 80% of the total funding indicated in technology and capacity building will be financed from international sources and donor institutions.

The PRC INDC did not specify estimates on financing requirements. However, the PRC shared its view that the climate agreement should stipulate that developed countries provide new, additional, adequate, predictable, and sustained financial support to developing countries for their enhanced actions, and further, it should provide quantified financing targets and road map to achieve them. The important role of the GCF was highlighted, including the need to strengthen the GCF to fulfill its role as an important operating entity of the financial mechanism of the UNFCCC.

### **3. Pacific**

Most of the Pacific INDCs provided partial or preliminary indication on financing requirements, based on early estimation of mitigation and/or adaptation measures. The Nauru INDC specified the preparation of detailed cost estimates as an important next step to be undertaken in conjunction with detailed design of the activities. The Cook Islands, the Federated States of Micronesia, the Marshall Islands, Papua New Guinea, Samoa, and Tuvalu acknowledged the importance of financing support but did not specify financing estimates to implement the INDCs.

The DMCs' intended contributions and outlined mitigation and adaptation actions set out in the INDC or in national strategies/plans are heavily dependent on international/external support on financing, capacity building, and technology transfer, and, in some cases, such as for Papua New Guinea and Nauru, to supplement domestic resources. Fiji, Kiribati, Nauru, Palau, Samoa, and Solomon Islands acknowledged the importance of collaboration and engagement with development partners on the implementation of the mitigation/adaptation measures.

For the Federated States of Micronesia, Kiribati, Solomon Islands, Samoa, and Vanuatu, a considerable portion of the necessary financing is intended to be accessed from available international climate change financing mechanisms such as grants from the GCF, GEF, Adaptation Fund, and from various bilateral climate change programs. These DMCs intend to build capacity or enhance institutional arrangements to facilitate direct access to these financing mechanisms.

### **4. South Asia**

Most of the DMCs in South Asia did not provide an estimate/indication on financing requirements in the implementation of their INDCs. While Bangladesh and India provided some figures, the numbers are currently partial (i.e., in terms of time period and accounted climate measures). India indicated its intention to undertake and provide detailed assessment at a later date.

The South Asia DMCs' intended contributions are dependent on domestic resources and on the availability of financial (as well as technical) support. International/external support on finance, investments, technology development and transfer, and capacity building is acknowledged as necessary in meeting conditional (increased) targets in all INDCs, and to address the impacts of climate change. Specifically for Nepal, the need for technical and financial support from development partners to provide relevant technologies and build capacity to be cleaner and greener was highlighted. Bangladesh intends to carry out a gap analysis of existing institutional framework and strengthen institutions for the effective access of international climate finances including the GCF. Similarly, India will seek access to the GCF to achieve the target on electric power installed capacity from nonfossil fuel-based energy sources.

## 5. Southeast Asia

The INDCs of Southeast Asia DMCs did not provide concrete estimates on required financing to implement the mitigation/adaptation actions specified. Cambodia and the Lao PDR indicated partial/preliminary estimates, with a caveat that a further review and update of the estimates will be made for consistency/accuracy when more reliable data/information are available. The review will determine the precise nature and level of support needed, in particular with respect to capacity building and technology transfer.

The DMCs' intended contributions and outlined mitigation and adaptation actions set out in the INDCs are largely dependent on international/developed country support on financing, capacity building, and technology transfer. Specifically for the Lao PDR, the setting up of effective arrangements for liaison with, among others, international stakeholders and development partners at the national and local levels to facilitate implementation of INDCs was highlighted. Meanwhile, the conditional targets of both Indonesia and Thailand are provisioned on the global agreement under the UNFCCC, including through bilateral cooperation.

For Cambodia and the Philippines, the GHG emission reduction targets are purely conditional on international assistance, while for the rest, the targets contain conditional and unconditional components. The Philippines highlighted its vulnerability, and thus, public financing will prioritize adaptation to reduce vulnerability and risks to the community as well as provide a policy environment that will enable private sector participation to optimize mitigation opportunities and reduce business risks toward a climate smart development. For Cambodia, the international finance support is needed additional to what the country is allocating to implement its sustainable development plans to realize the identified positive impacts of GHG emission reduction activities.

Myanmar highlighted that the success of the mitigation and adaptation activities wholly depends on receiving sufficient technology-transfer, capacity-building, and financial support from developed and more experienced countries, international agencies, donors, and the wider international community.

## V. ADB STRATEGIC APPROACH

ADB recognizes the important opportunity that adoption of INDCs provides in terms of guiding future ADB operations. The review of each DMC commitment is intended to support the internal assessment of ADB's current country program/pipeline to determine extent of alignment with the stated priorities of the DMC with regard to climate action, and consider if and how ADB might scale up support. Understanding the ADB program alignment with INDCs should facilitate discussion between ADB and each DMC as to whether and how the country would expect additional or different forms of support on climate actions from ADB. The compilation and evaluation of information on INDCs presented in this paper is drawn from the initial effort at such a review. Initial review of the alignment of ADB programs and INDCs shows that ADB is broadly supporting the climate-relevant sectors in most countries: energy, urban, water resources, etc.

ADB is currently defining its long-term climate change strategic directions through 2030.<sup>36</sup> The first time period covers 2016–2020 and is intended to facilitate a strategically oriented program of activities by ADB to help meet its \$6 billion climate change investment target, including \$4 billion for mitigation and \$2 billion for adaptation, and also to mobilize other financial and technical assistance resources to complement and support ADB actions. The climate change strategic directions will enable ADB to shift from an opportunity-based approach to funding climate action in DMCs and at the subregional and regional levels to a much more strategic, tactical approach based on countries' NDCs.

In addition to the scaled-up financing target, ADB recognizes the importance of technology and partnerships in tackling climate change and supporting DMCs in the implementation of the INDCs. It intends to continue in facilitating the integration of cleaner and more advanced technology in projects and working through strengthened partnerships to provide knowledge and capacity-building support.

Considerable investment opportunities exist and are growing for renewable energy in DMCs. There are also significant opportunities for investment in clean transport and energy efficiency, but these present more challenges to accelerate scaled-up investments. The key low-carbon investment opportunities appear to be in the rapidly growing urban industrial complexes across the region. At the same time, the most significant funding required for adaptation is to transform numerous Asian cities from being highly vulnerable to climate impacts to being highly resilient. In this regard, urban growth presents to ADB an opportunity to help its DMCs avoid being locked in to inefficient, high-carbon, high climate vulnerability development paths. By taking a longer-term outlook to 2030, ADB will look at future scenarios for urban/industrial growth and similar development trajectories. This will enable ADB to maximize its developmental impact over the coming 10–15 years by helping the region's developing countries transition to sustainable low-carbon, climate-resilient development as quickly as possible, while optimizing local and global benefits.

---

<sup>36</sup> Working title. This is intended to provide a foundation for the new directions that ADB will take on climate change over the coming 15 years in response to the rapidly changing economic, social, and environmental setting.

## VI. CONCLUSIONS

A key building block of the Paris Agreement is the INDCs that have been submitted by developed and developing countries to the UNFCCC ahead of or at COP21. The INDCs, which become NDCs upon ratification and effectivity of the Paris Agreement, communicate the measures countries intend to undertake after 2020 to (i) reduce GHG emissions; (ii) adapt to climate change; and in the case of developed countries (iii) provide financial, technological, and capacity-building support to developing countries. All but two of ADB's DMCs submitted an INDC. The NDCs should eventually serve as country-driven road maps for climate action which ADB and other sources of climate/development finance and technical assistance will utilize to identify those sectors and locations for which they provide climate change-related support.

The review of the DMC INDCs shows that there is a large range in the details presented by each country with regard to the actions and their estimated costs, as well as the need for external financial and technical support. None of the INDCs would match a "sector investment plan" in terms of technical, spatial, temporal, and financial details which ADB operational departments are accustomed to relying on for country operational planning. However, a few DMC INDCs are adequately detailed and therefore can be readily translated into climate action plans that are similar in planning detail to sector plans. Many of the more detailed INDCs are summaries of more detailed national climate action plans and other sector plans—these can be readily built upon to translate them into climate investment plans/road maps. Well-developed NDCs will be useful in facilitating a country dialogue with ADB and other sources of financial and technical assistance. Currently, less detailed INDCs indicate a need for support from institutions, such as ADB, to define objectives and outline actions that will help a country meet its objectives and commitments and then set priorities for investments in the form of climate investment plans. ADB will work with other international and bilateral development assistance partners at the regional and DMC levels to agree on how the development assistance community can most effectively and efficiently (avoiding duplication) support DMCs to improve the clarity and detail of NDCs, and subsequently support their implementation.

## APPENDIX 1

### Brief Review on Assessment of Intended Nationally Determined Contributions of Selected ADB Developing Member Countries

In December 2015, at the United Nations Climate Change Conference (COP21) in Paris, 195 countries adopted the first universal and binding global climate deal.<sup>1</sup> The Paris Agreement sets out a global action plan to avoid dangerous climate change by limiting global warming well below 2°C and, if possible, below 1.5°C. In support of the agreement, developing member countries (DMCs) of the Asian Development Bank (ADB) have prepared and submitted their Intended Nationally Determined Contributions (INDCs), which outline their post-2020 climate actions in achieving climate resilience and reducing greenhouse gas (GHG) emissions, appropriate to their national circumstance.

This review provides an overview of the early analysis of the INDCs, with focus on four DMCs: the People's Republic of China (PRC), India, Indonesia, and the Philippines. It mainly covers the following references, supplemented with other INDC-related documents available online:

- i) a working paper prepared by the World Resources Institute, which evaluates the transparency of GHG targets presented and presents the GHG emissions trajectories of top emitting Parties;<sup>2</sup>
- ii) assessments by the Climate Action Tracker (CAT), an independent scientific analysis by research organizations tracking climate action, on whether countries are on track to meet the pledges, given currently implemented policies, and rated their pledges against the range of emission levels they should aim for in the framework of a 2°C global pathway;<sup>3</sup> and
- iii) an assessment by the PBL Netherlands Environmental Assessment Agency, which provides an overview of the INDCs submitted and analyses on their level of ambition.<sup>4</sup>

#### I. People's Republic of China

On 30 June 2015, the PRC became the first among ADB's DMCs to submit its INDC. The PRC's intended contributions are as follows:

- Achieve peaking of carbon dioxide (CO<sub>2</sub>) emissions by 2030, with best efforts to peak early
  - Lower CO<sub>2</sub> emissions per unit of gross domestic product (GDP) by 60%–65% by 2030 compared with 2005 level
  - Increase the share of nonfossil fuels in primary energy consumption to about 20%
  - Increase the forest stock volume by about 4.5 billion cubic meters on the 2005 level
- Continue to proactively adapt to climate change through enhanced mechanism and capacity building; the effective management of climate change risks in the agriculture, forestry, and water resources sectors, and in regions including urban, coastal, and ecologically vulnerable areas; improved early warning and emergency response systems and disaster prevention and mitigation mechanisms

<sup>1</sup> United Nations Framework Convention on Climate Change. UN Climate Change Newsroom. <http://newsroom.unfccc.int/unfccc-newsroom/finale-cop21/>

<sup>2</sup> T. Damassa et al. 2015. Interpreting INDCs: Assessing Transparency of Post-2020 Greenhouse Gas Emissions Targets for 8 Top Emitting Economies. Working Paper. Washington DC: World Resources Institute. [http://www.wri.org/sites/default/files/WRI\\_WP\\_InterpretingINDCs.pdf](http://www.wri.org/sites/default/files/WRI_WP_InterpretingINDCs.pdf)

<sup>3</sup> The CAT provides an up-to-date assessment of the individual reduction targets with an overview of their combined effects to provide transparency on the pledges and to encourage governments to make or increase their pledges. The CAT tracks 32 countries covering about 80% of global emissions and assesses the total global efforts of INDCs, pledges and current policies on global warming over the 21st century and emissions gap. <http://climateactiontracker.org>

<sup>4</sup> A. Admiraal et al. 2015. Assessing Intended Nationally Determined Contributions to the Paris Climate Agreement – What Are the Projected Global and National Emission Levels for 2025--2030? The Hague: PBL Netherlands Environmental Assessment Agency. [http://www.pbl.nl/sites/default/files/cms/publicaties/pbl-2015-assessing-intended-nationally-determined-contributions-to-the-paris-climate-agreement\\_1879.pdf](http://www.pbl.nl/sites/default/files/cms/publicaties/pbl-2015-assessing-intended-nationally-determined-contributions-to-the-paris-climate-agreement_1879.pdf)

**World Resources Institute paper:**

- The PRC's INDC does not articulate a level at which CO<sub>2</sub> emissions should peak and does not specify a base level against which its target carbon intensity reduction will be measured. It misses important inputs such as the comprehensive breakdown of economic sectors covered, indication of potential emission reduction for non-CO<sub>2</sub> gases, and accounting assumptions or methodologies when evaluating the CO<sub>2</sub> emissions targets. Results on the PRC's energy-related CO<sub>2</sub> emissions in 2030 range from 10.7 GtCO<sub>2</sub> to 18.1 GtCO<sub>2</sub>, and in 2020, from 9.8 GtCO<sub>2</sub> to 13.7 GtCO<sub>2</sub>.

**Climate Action Tracker analysis:<sup>5</sup>**

- The emission levels estimated for 2025 and 2030 resulting from all aspects of the INDC, except the carbon intensity target, is rated medium. However, the resulting emissions from the carbon intensity target, if taken in isolation, are significantly higher and would rate as inadequate, in terms of limiting warming to below 2°C. Additionally, the weak INDC carbon intensity targets would also be met at the expense of important national policies and actions, which are assessed as unlikely.
- Under a scenario with currently implemented policies, the PRC's CO<sub>2</sub> emissions are likely to peak around 2025, or shortly after, partly due to important restrictions on coal consumption in the period from now until 2020, as well as other policies. However, total GHG emissions are likely to continue increasing until 2030, as the PRC has not yet implemented sufficient policies addressing non-CO<sub>2</sub> GHG emissions (methane, nitrous oxide, hydrofluorocarbons [HFCs], etc.).

**PBL Netherlands Environmental Assessment Agency analysis:**

- Substantive absolute emission reductions from business-as-usual (BAU) levels for the PRC and for emissions to peak by 2030 or later are expected; however, it notes that the INDC projection for the PRC is subject to uncertainties, relating to GDP growth rate projections and the implementation of policies announced in the submitted INDCs. For instance, a 1% change in the PRC's average annual economic growth would already result in a change in the emissions target of approximately 2.5 GtCO<sub>2</sub>e in the estimates of the PRC's INDC.

**Carbon Brief analysis:<sup>6</sup>**

- The PRC is on course to peaking CO<sub>2</sub> emissions as early as 2027, given its additional carbon intensity reduction target. Using GDP projections from the Organisation for Economic Co-operation and Development (OECD), the analysis shows CO<sub>2</sub> emissions could peak at about 12.7 billion tons in 2027 or possibly earlier if potential for cost-effective energy efficiency improvements (particularly in industry) is exploited. Also, the country's massive build-out on renewables is aligned with the goal to source 20% of energy needs from nonfossil sources.

A paper from the China National Center for Climate Change Strategy and International Cooperation also provided an analysis of the PRC's INDC in terms of its basic assumptions and considerations, the ambition and fairness of the intended contributions, and the obstacles and challenges facing the PRC in achieving these goals.<sup>7</sup>

- Under the INDC targets and through its innovate development pathway, the PRC will be sure to maintain its cumulative energy-related CO<sub>2</sub> emissions by 2030 lower than those of the United States and the European Union.
- The PRC's INDC contains a range of implementation measures and policies designed to mitigate existing climate change risk and fulfill the INDC's mandate across mitigation, adaptation, financing, technology development and transfer, capacity building, and transparency.

<sup>5</sup> Climate Action Tracker – China. <http://climateactiontracker.org/countries/china.html>

<sup>6</sup> Carbon Brief. Climate Pledge Puts China on Course to Peak Emissions as Early as 2027. <http://www.carbonbrief.org/climate-pledge-puts-china-on-course-to-peak-emissions-as-early-as-2027>

<sup>7</sup> F. Sha, Z. Ji, and L. Linwei. n.d. *An Analysis of China's INDC*. China National Center for Climate Change Strategy and International Cooperation. <http://www.chinacarbon.info/wp-content/uploads/2015/07/Comments-on-Chinas-INDC.pdf>

## II. India

On 1 October 2015, India submitted its INDC outlining the following intended contributions:

- Reduce emission intensity of its GDP by 33%–35% by 2030 compared with 2005 (no bind on any sector specific mitigation obligation/action)
- Achieve 40% cumulative electric power installed capacity from nonfossil fuel-based energy resources by 2030 (with transfer of technology and low-cost international finance)
- Create an additional carbon sink of 2.5–3 billion tons of CO<sub>2</sub> equivalent through additional forest and tree cover by 2030
- Better adapt to climate change by enhancing investments in development programs for vulnerable sectors: agriculture, water resources, Himalayan region, coastal regions, health, and disaster management

### World Resources Institute paper:

- India's emission intensity target does not specify a 2005 level against which the 2030 target will be measured, as well as information on target coverage (in terms of sector and GHG) and details on specific international finance, technology, and capacity-building requirements, in particular its alignment with the implementation of the INDC.
- Indicates that India's emissions level will be 2.9–3.4 GtCO<sub>2</sub>e by 2020, and will continue to rise through 2030 to 4.3–6.9 GtCO<sub>2</sub>e (5.8–9.2 GtCO<sub>2</sub>e if agriculture and net land-sector sequestration are included).

### Climate Action Tracker analysis:<sup>8</sup>

- Makes the same assessment that the India INDC is lacking in detail and could be enhanced by describing GHG and sector coverage, the metric for the intensity target, and the way the nonfossil power capacity target is envisaged.
- However, it noted that India is likely to overachieve its 2030 climate intensity target without having to implement any new policies: with current policies in place, India would achieve about 41.5% decrease in emission intensity of GDP by 2030, and will decrease further if target share of nonfossil capacity is met, albeit conditional on international funding.<sup>9</sup>

### PBL Netherlands Environmental Assessment Agency:

- Substantive absolute emission reductions from BAU levels for India and for emissions to peak by 2030 or later, but also notes uncertainties relating to projections and implementation of policies announced.

### Carbon Brief analysis:<sup>10</sup>

- India's INDC is framed in terms of emission intensity. Given its growing economy and priorities on economic development, significant emissions growth up to 2030 is expected. India's emissions could reach about 6.5 billion tons of CO<sub>2</sub>e (ahead of expected emissions from the United States or the European Union, but less than half as much as the PRC's) by 2030, but notes that emissions would remain comparatively low in per capita terms.
- The 40% share of nonfossil-based power generation target is also seen as a modest increase from the current 30% nonfossil fuel capacity, and is likely to be exceeded if the targets on renewables ascribed in the INDC are met.

<sup>8</sup> Climate Action Tracker – India. <http://climateactiontracker.org/countries/india.html>

<sup>9</sup> Climate Action Tracker. India Likely to Far Exceed Emissions Intensity Target: Analysis. <http://climateactiontracker.org/publications/pressreleases/226/India-likely-to-far-exceed-emissions-intensity-target-analysis.html>

<sup>10</sup> Carbon Brief. Analysis: India's Climate Pledge Suggests Significant Emissions Growth up to 2030. <http://www.carbonbrief.org/indias-indc>

An article prepared by Dubash and Khosla in 2015 examined India's INDC with regard to India's climate development and international interest strategic choices.<sup>11</sup> It finds that the emission intensity pledge is on the "conservative end of the spectrum" that corresponds to relatively low levels of policy effort, but this is an indicative measure as there is a great deal of uncertainty in forecasting the country's development trajectory. In terms of absolute and per capita GHG emissions, using INDC's GDP estimate, the numbers suggest that India will contribute a larger share of annual global emissions but low per capita emissions.

### III. Indonesia

On 24 September 2015, Indonesia released its INDC containing the following intended contributions:

- Reduce emissions by 29% by 2030 compared with BAU
- Reduce emissions by 41% by 2030 compared with BAU (subject to provision in global agreement including through bilateral cooperation)

#### World Resources Institute paper:

- Indonesia's INDC misses some key elements, for instance, in its baseline scenario, information on whether the baseline scenario could change from current projections and under what circumstances, and the projected baseline for interim years to allow intermediate assessments; and the details on required international assistance (e.g., financing requirement) to achieve the emissions target.
- In terms of emissions trajectory, the Indonesia INDC provides few details (no additional information regarding BAU scenario) to permit assessment.

#### Climate Action Tracker analysis:<sup>12</sup>

- Rated the Indonesia INDC as inadequate, with profound lack of detail and credibility around both its emissions projections for deforestation, and its plans to slow emissions growth. The Indonesia INDC lacks detail on the share of climate action between reduced deforestation and emissions from energy, agriculture, and mining, with high uncertainty around emission projections for the land use sector.
- Further, while the INDC BAU indicates stable emissions from forestry through 2030 (from the BAU values, Indonesia's pledge corresponds to absolute emission levels of 1,336 MtCO<sub>2</sub>/year unconditionally by 2020, 2,046 MtCO<sub>2</sub>e/year unconditionally by 2030, and 1,700 MtCO<sub>2</sub>e/year conditionally by 2030), the CAT analysis expects increased emissions based on observed deforestation trends in recent years.

#### PBL Netherlands Environmental Assessment Agency:

- Based on the Indonesia INDC, (i) emissions are expected to peak before 2025; (ii) large absolute reductions in land-use emissions and net land use, land-use change, and forestry (LULUCF) emissions are also expected from Indonesia; and (iii) emission intensities are expected to decline substantially between 2010 and 2030.

#### Carbon Brief analysis:<sup>13</sup>

- Indonesia's pledge has multiple uncertainties and lacks key specifics such as on policy priorities, financing needs, current emissions, and calculation of BAU trajectory. It does not contain information on the policy priorities it sets out and the needed international climate finance to meet the 2030 emissions targets.

<sup>11</sup> N.K. Dubash and R. Khosla. 2015. Neither Brake nor Accelerator: Assessing India's Climate Contribution. COP21 Side Event: How will INDCs Shape Development. *Economic and Political Weekly*. L(42). [https://seors.unfccc.int/seors/attachments/get\\_attachment?code=K3UM38C1UCCJ5I95TBYFUKDF76M55Z5C](https://seors.unfccc.int/seors/attachments/get_attachment?code=K3UM38C1UCCJ5I95TBYFUKDF76M55Z5C)

<sup>12</sup> Indonesia's Climate Plans Lack Transparency and Credibility. <http://climateactiontracker.org/publications/pressreleases/230/Indonesias-climate-plans-lack-transparency-and-credibility.html>

<sup>13</sup> Carbon Brief. Indonesian Pledge Suggests No Increase in Emissions to 2030. <http://www.carbonbrief.org/indonesian-pledge-suggests-no-increase-in-emissions-to-2030>

- The analysis noted that the INDC had no mention of coal while the country has major plans to expand its coal-fired electricity generation. The INDC has also omitted from a previous draft an international climate finance estimate (~\$6 billion) which is perceived to exclude higher investment needs on renewables.

#### IV. Philippines

On 1 October 2015, the Philippines submitted its INDC with the following intended contribution:

- GHG (CO<sub>2</sub>e) emission reduction of about 70% by 2030 compared with BAU (conditional on extent of financial resources, including technology development and transfer, and capacity building) covering all sectors, including LULUCF.
- Mainstream climate change and disaster risk reduction in planning and programming at all levels.

#### CAT analysis:<sup>14</sup>

- Provided the Philippine INDC a medium rating, which indicates that the commitments are “at the least ambitious end of what would be a fair contribution” and not consistent with limiting warming to below 2°C unless reductions are compensated by other countries’ greater efforts. The INDC provides large uncertainties as it does not quantify BAU projections and future LULUCF emissions to clarify INDC targets with quantified emission levels.
- The CAT also noted the need for additional policies to be implemented for the Philippines to meet its conditional target, and the possibility of not meeting the INDC target given the announced coal-fired power plant capacity to be constructed.

<sup>25</sup> The INDC identifies the barriers for implementation to the mitigation opportunities which are outlined herein.

ADB Focus Area	MYANMAR	
	Commitment <sup>26</sup>	Financing Needs
<b>Intended Nationally Determined Contribution Highlights</b>	<ul style="list-style-type: none"> <li>• National Climate Change Policy in 2016</li> <li>• Mitigation in energy and forestry (no emission estimates)<sup>27</sup></li> <li>• Resilience in agriculture, early warning systems, forest preservation, public health, water resources management, coastal zone protection, energy, industry, and biodiversity</li> </ul>	
<b>Commitment Conditionality</b>	Conditional target	
<b>Agriculture and Food Security</b>	<ul style="list-style-type: none"> <li>• By 2030, Myanmar's permanent forest estate (PFE) target is to increase national land area as forestland               <ul style="list-style-type: none"> <li>➢ Reserved Forest (RF) and Protected Public Forest (PPF) = 30% of total national land area</li> <li>➢ Protected Area Systems (PAS) = 10% of total national land area</li> </ul> </li> <li>• Decrease the rate of deforestation</li> <li>• Preserve natural forest cover to maintain biodiversity and ecosystems in Myanmar</li> <li>• Realize the co-benefits of the policy such as reducing soil erosion, thereby decreasing the risk of floods and landslides that may occur near rivers</li> <li>• Increase the resilience of mangroves and coastal communities that are at risk of flooding.</li> <li>• Increase capacity on Sustainable Forest Management.</li> <li>• Mitigate GHG emissions from the agriculture sector from combustion of agricultural residues and growing rice in paddy fields.</li> <li>• National Adaptation Programme of Action (NAPA) Priorities: resilience in the agriculture sector, forest preservation measures</li> </ul>	<ul style="list-style-type: none"> <li>• With the scale of the adaptation effort, considering the current level of capacities, and the trend of worsening changes in climate, means major support and investment is required. Investments, both from the Private and Public International Cooperation, will be oriented toward capacity building and technology development and transfer.</li> <li>• Myanmar will develop appropriate mechanism for monitoring of climate vulnerability, funds allocated for adaptation and the results of adaptation actions.</li> <li>• Myanmar requires the support of the international community in improving its planning and monitoring for adaptation efforts, and to implement priorities which may be re-prioritized.</li> <li>• The success of the mitigation and adaptation activities in</li> </ul>
<b>Education</b>		
<b>Energy</b>	<ul style="list-style-type: none"> <li>• Increase the share of hydroelectric generation within limits of technical hydroelectric potential. Indicative goal – 9.4 gigawatts (GW) by 2030</li> <li>• Increase access to clean sources of electricity among communities and households currently without access to an electric power grid system.               <ul style="list-style-type: none"> <li>➢ Indicative goal: Rural electrification through use of at least 30% renewable sources (mini-hydro, biomass, solar, wind, and solar minigrid technologies) to generate electricity supplies.</li> </ul> </li> <li>• To increase the number of energy-efficient cookstoves disseminated to reduce the amount of fuelwood used for cooking.               <ul style="list-style-type: none"> <li>➢ Indicative goal: To distribute approximately 260,000 cookstoves between 2016 and 2031.</li> </ul> </li> <li>• Achieve the optimal level of renewable sources in the primary energy fuel supply mix</li> <li>• Increase understanding on renewable power potential and support preparation of sustainable policies and strategies including formulation of Energy Master Plan</li> <li>• NAPA Priority: energy sector</li> </ul>	
<b>Environment, Climate Change, and Disaster Risk Management</b>	<ul style="list-style-type: none"> <li>• Mitigation in energy and forestry (no emission estimates)</li> <li>• Achieve climate-resilient, low-carbon, resource-efficient, and inclusive development as a contribution to the overall policy for sustainable development.</li> <li>• Mainstream environment and climate change into the national policy development and reform agenda.</li> <li>• Strengthen the climate change-related institutional and policy environment through sharing of technical knowledge and best practice, training and institutional support.</li> <li>• Promote evidence-based planning and policy making through the integration of climate change mitigation experience into subnational, state, and regional development planning initiatives.</li> <li>• Increase awareness of climate change at the national, state and region, and local levels.</li> <li>• Promote an economy based on green growth.</li> <li>• Consistently monitor and take stock of the status of national environmental quality.</li> <li>• NAPA Priorities: development of early warning systems, coastal zone protection, biodiversity preservation</li> </ul>	

<sup>26</sup> A costing exercise, including considering short-, medium-, and long-term priorities, will be conducted to ensure the implementation plan has the necessary resources to deliver on intended contributions, intended actions, and future policy development. Financial support will first need to be determined by completing a detailed costing estimate in the very short term. The financial support will be utilized in a variety of ways including, but not limited to, technology needs assessment for mitigation and adaptation activities, implementation of identified actions in the forestry and energy sectors, addressing financial needs of other key sectors, etc.

<sup>27</sup> The information required to estimate GHG emissions was collected and an estimate was produced. However, given the deadline and the current available data, it was decided not to include the estimate in the INDC, which was deemed not sufficiently reliable. Further analysis to quantify the GHG emission will be conducted as a result of the identified actions and strategies in the INDC.

ADB Focus Area	MYANMAR

## **Assessing the Intended Nationally Determined Contributions of ADB Developing Members**

At the United Nations Climate Change Conference in Paris in December 2015, 195 countries adopted the first universal global climate agreement which sets out a global action plan to combat climate change. The Paris agreement is anchored on the implementation between 2020 and 2030 of nationally determined contributions. Ahead of or at the Paris conference and in support of reaching an international climate change agreement, countries submitted intended nationally determined contributions which outline their post-2020 climate actions. This working paper provides a preliminary review of the intended nationally determined contributions of ADB developing members. The review of each member commitment is intended to determine the extent to which ADB's current country program is aligned with the country priorities with regard to climate action and consider if and how ADB might scale up support.

### **About the Asian Development Bank**

ADB's vision is an Asia and Pacific region free of poverty. Its mission is to help its developing member countries reduce poverty and improve the quality of life of their people. Despite the region's many successes, it remains home to half of the world's extreme poor. ADB is committed to reducing poverty through inclusive economic growth, environmentally sustainable growth, and regional integration.

Based in Manila, ADB is owned by 67 members, including 48 from the region. Its main instruments for helping its developing member countries are policy dialogue, loans, equity investments, guarantees, grants, and technical assistance.
